APPENDIX D.........Garbage and Blue Box Composition Data
APPENDIX E.........Existing Waste Diversion Program Data
APPENDIX F.........Potential Materials to be added to the Blue Box Program

## 1. Introduction

This Waste Recycling Strategy (WRS) was initiated by The Corporation of the City of London (the City) to develop a plan to increase the efficiency and effectiveness of its recycling programs and maximize the amount of blue box material diverted from disposal. Specifically, the purpose of this recycling plan is to:

- Maximize capture rates of blue box materials through existing and future waste diversion programs
- Improve the cost effectiveness of recycling in our community

The City manages its residential solid waste through a number of existing programs and services including curbside garbage and recycling collection, multiresidential garbage and recycling collection, curbside yard material collection from April to December, two 'EnviroDepot' drop locations which accept various waste streams, a Household Special Waste Depot for the safe disposal of residential hazardous waste and the W12A Landfill site which accepts residential garbage and recycling as well as other waste streams from the residential and IC\&I sectors.

The City faces a number of waste management challenges that this Waste Recycling Strategy will consider. In particular, this strategy will help the City:

- Increase diversion
- Meet the Waste Diversion Ontario (WDO) requirement for Ontario Municipalities to have a diversion strategy in place
- Maximize program funding through the adoption of Blue Box best practices
- Explore opportunities that could increase the capture rate of recyclable materials and reduce overall recycling costs

This Waste Recycling Strategy was developed with support from the Continuous Improvement Fund (CIF) and using the CIF's Guidebook for Creating a Municipal Waste Recycling Strategy.

## 2. Overview of the Planning Process

This Waste Recycling Strategy was prepared through the efforts of the City of London Solid Waste Management Division staff and include:

- Four season waste audit of City garbage and recycling conducted in 2012/2013
- Review of the waste management programs of other municipalities
- Dedicated page on the City website providing information and allowing feedback
- Public consultation program including:
- Participation meetings with local community groups
- Outreach in a mixed-use public 'storefront' over a month-long period
- Staffed display at local community events
- Interactive display toured through over 15 public City facilities
- Consolidation and review of public communications stemming from feedback request in public displays, billboard advertising, social and traditional media

Information on the public consultation program is provided in Appendix A.

## 3. Study Area

The study area for this Waste Recycling Strategy consists of the City of London and will address recycling within the residential curbside and multi-residential sectors.

This plan will not focus on materials generated within the industrial, commercial and institutional sector (IC\&I) as in most cases these locations independently manage the collection of their solid waste. This does not preclude commercial locations located along existing residential recycling routes which are thereby permitted to participate in the curbside collection program.

## 4. Stated Problem, Goals and Objectives

Management of municipal solid waste, including the diversion of blue box materials, is a key responsibility for all municipal governments in the Province of Ontario. Factors that encourage or hinder municipal blue box recycling will vary greatly between locales and depend on a municipality's size, geographic location and population. The key drivers that led to the development of this particular Waste Recycling Strategy include:

- Identifying opportunities for waste management system efficiencies
- Improving the diversion rate and recovering more recyclables
- Servicing a growing population

The purpose of this Waste Recycling Strategy (WRS) is to provide the City with a plan for improving the blue box recycling program over the next 5 years. Specifically the goals of the WRS will include:

- To provide direction on the future evolution of the City's residential recycling program
- To identify how to best increase residential waste diversion through recycling
- To identify opportunities for improving cost efficiencies
- To increase participation in the recycling program

## 5. Current Solid Waste Trends, Practices and System and Future Needs

### 5.1 Community Characteristics

In 2012 for waste generation purposes, the City of London had a total population of 387,700 , which consisted of a permanent population of 367,400 and seasonal student population of 20,300 (approximately 50,000 students generate equivalent waste as 20,300 permanent residents). The municipality is home to approximately 117,000 single-family households as well as 50,100 multiresidential households. More details on the demographics of the City of London are provided in Appendix B.

### 5.2 Historical Waste Generation and Diversion

The tables below summarize the historical waste generation and blue box diversion rates for the City from 2002 to 2012.

Table 1: Residential Solid Waste Generated and Diverted

| Material | 2002 |  | 2007 |  | 2012 |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Tonnes | $\%$ of <br> Total | Tonnes | $\%$ of <br> Total | Tonnes | $\%$ of <br> Total |
| Blue Box Recyclables | 21,500 | $15 \%$ | 27,200 | $17 \%$ | 26,500 | $17 \%$ |
| Organics Program | 21,100 | $15 \%$ | 24,300 | $16 \%$ | 28,700 | $19 \%$ |
| Other | 6,500 | $4 \%$ | 8,700 | $6 \%$ | 11,400 | $8 \%$ |
| Total Diverted | 49,100 | $34 \%$ | 60,200 | $39 \%$ | 66,500 | $44 \%$ |
| Total Disposed | 93,500 | $66 \%$ | 93,200 | $61 \%$ | 86,100 | $56 \%$ |
| Total Generated | $\mathbf{1 4 2 , 6 0 0}$ |  | $\mathbf{1 5 3 , 4 0 0}$ |  | $\mathbf{1 5 2 , 6 0 0}$ |  |

Table 2: Residential Recycling Generated through Blue Box

|  | 2002 |  | 2007 |  | 2012 |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Tonnes | $\%$ | Tonnes | $\%$ | Tonnes | $\%$ |
| 1. Paper (ONP/OMG/fine <br> papers) | 11,400 | $53 \%$ | 14,400 | $53 \%$ | 14,300 | $54 \%$ |
| 2. Paper Packaging (OCC, <br> OBB) | 4,800 | $22 \%$ | 6,800 | $25 \%$ | 5,900 | $22 \%$ |
| 3. Plastics | 800 | $4 \%$ | 1,600 | $6 \%$ | 2,500 | $10 \%$ |
| 4. Metals | 1,200 | $6 \%$ | 1,300 | $5 \%$ | 1,400 | $5 \%$ |
| 5. Glass | 3,300 | $15 \%$ | 3,100 | $11 \%$ | 2,400 | $9 \%$ |
| Total | 21,500 |  | $\mathbf{2 7 , 2 0 0}$ |  | $\mathbf{2 6 , 5 0 0}$ |  |

More details on the historical waste generation and diversion for the City of London are provided in Appendix C.

It can be noted that the above tables show the weight of recyclables is lower in 2012 than 2007. This is a result of a number of factors including:

- "Light weighing" of existing packaging (e.g., thin-walling of PET plastic bottles)
- Transition of materials away from heavier (e.g., glass) to lighter packaging (e.g., plastics, multi-laminate pouches, etc.)
- Introduction of deposit return for LCBO bottles

It is noted that although the weight of recycled materials was marginally lower between 2012 and 2007, the volume of recyclables had gone up 20-30\% (see below). This means the effort (and cost) to recycle a tonne of recyclable is increasing.

Currently, the City generates approximately 152,600 tonnes of residential solid waste per year. Of this, 26,400 tonnes or $17 \%$ is diverted through the blue box program.

### 5.3 Current Curbside \& Multi-Residential Waste (Garbage \& Recycling) Composition

A four season curbside waste audit was conducted in the City between the summer of 2012 and the spring of 2013. This data was used to estimate the current composition of the City's garbage and recyclables. Details of the curbside waste audits, their results and the resulting estimates of the compositions of the City's garbage and recyclables are presented in Appendix D.

A high level summary of what remains in the garbage is presented in Table 3.

Table 3 indicates there is approximately 15,000 tonnes of Blue Box recyclables still available for diversion in London's garbage. This consists of approximately 11,000 tonnes of recyclable materials that is part of the City's program and 4,000 tonnes of recyclables of materials that could potentially be added to the City's program.

Table 3: Summary of 2012 Garbage Composition

| Material Category | 2012 |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Curbside (Single Family Dwellings) |  | Multi-Residential |  | Total |  |
|  | Total tonne/yr | $\begin{aligned} & \text { \% Blue } \\ & \text { Box } \\ & \text { Capture } \end{aligned}$ | Total tonne/yr | $\begin{aligned} & \text { \% Blue } \\ & \text { Box } \\ & \text { Capture } \end{aligned}$ | Total tonne/yr | $\begin{aligned} & \hline \text { \% Blue } \\ & \text { Box } \\ & \text { Capture }^{\text {a }} \end{aligned}$ |
| Blue Box Recyclables |  |  |  |  |  |  |
| Paper | 3,853 | 83\% | 3,510 | 42\% | 7,363 | 74\% |
| Plastic | 997 | 67\% | 657 | 30\% | 1,654 | 58\% |
| Metal | 652 | 66\% | 460 | 26\% | 1,112 | 57\% |
| Glass | 509 | 81\% | 436 | 35\% | 945 | 71\% |
| Total Blue Box Recyclables | 6,011 | 80\% | 5,063 | 39\% | 11,074 | 71\% |
| Other Potential Blue Box Materials |  |  |  |  |  |  |
| Beverage Cups/lce Cream Containers | 352 |  | 121 |  | 473 |  |
| Expanded Polystyrene | 256 |  | 83 |  | 339 |  |
| Plastic Bags/Film | 2,388 |  | 773 |  | 3,161 |  |
| Total Other Potential Blue Box | 2,996 |  | 977 |  | 3,973 |  |
| Other |  |  |  |  |  |  |
| Municipal Hazardous \& Special Waste | 254 |  | 46 |  | 300 |  |
| Food Waste | 22,065 |  | 6,919 |  | 28,983 |  |
| Yard Waste | 1,193 |  | 312 |  | 1,504 |  |
| Textiles | 1,842 |  | 818 |  | 2,660 |  |
| Construction \& Demolition | 1,899 |  | 843 |  | 2,742 |  |
| Carpeting | 958 |  | 426 |  | 1,384 |  |
| Electronics | 648 |  | 288 |  | 935 |  |
| Other Non-recyclable Materials | 19,784 |  | 7,209 |  | 26,993 |  |
| Total Other | 48,643 |  | 16,860 |  | 65,503 |  |
| Grand Total | 57,650 |  | 22,900 |  | 80,550 |  |

Notes (a) Percentage of material that is not in the garbage (placed in Blue Box).

### 5.4 Future Residential Waste (Garbage \& Recycling) Quantities

Information from the report A Study of the Optimization of Blue Box Material Processing System in Ontario (June, 2012) was used to estimate how the waste generation rates would change in the future. This report suggests there will be significant changes to generation rates between now and 2025. In general the generation rates for paper, metals and glass will decrease while the generation rates for paper packaging and plastics will continue to increase. Information of the forecasted changes to the waste generation rates is presented in Appendix D.

### 5.5 Existing Recycling Programs and Services

A description of the City's various waste diversion programs and the quantity of material diverted by each program in 2012 is presented in Appendix E.
Programs specific to Blue Box recycling are summarized below:

- Residential Curbside Recycling: The City of London has a two stream curbside recycling program collected alongside household garbage on a 6 day work-schedule. Residents may place separated fibres and containers at the curb for collection inside plastic Blue Boxes. This program diverted 22,960 tonnes in 2012.
- Multi-Residential Recycling: Multi-Residential locations may receive scheduled pickup of recyclable materials separated into two streams within 95 gallon carts. The City also has 4 or 6 yard bins at 50 buildings for separate collection of cardboard. This program diverted 3,290 tonnes in 2012.
- Depots: Three 'EnviroDepot' locations across the city that accepts household garbage, yard materials, blue box recyclables, tires, propane tanks \& cylinders, batteries, electronics, compact fluorescent light bulbs and tubes, empty oil and anti-freeze containers, construction and demolition materials, and scrap metal. The City also operates a Household Special Waste Depot at the W12A landfill that accepts hazardous and special waste from residents and small businesses. This program diverted 370 tonnes of Blue Box recyclables in 2012.
- Public Space Recycling: Public space recycling is available within the Downtown Core as well as at various municipally run facilities and selected parks across the city. This program diverted 50 tonnes in 2012.

Collection of residential waste is provided to the residents primarily by the City, while recycling collection is provided mainly by contractors. These programs and services are paid for by funding from stewards (funding from Waste Diversion Ontario), general taxes, and revenues from the sale of recyclables.

Once recyclable materials have been collected, they are taken to the City of London Manning Drive Regional Material Recovery Facility, located in London, Ontario.

Potential collection-related program changes that may affect recycling collection services include:

- Collection of new material types
- Elimination of plastic bags as an approved recycling container
- Institution of a Downtown Core OCC cardboard collection program
- Expansion of the Multi-Residential OCC cardboard collection program

### 5.6 Recycling Costs

## Comparison to Other Municipalities

In 2012, the total net annual recycling cost for the City of London was
$\$ 6,527,860$. This amounts to $\$ 245$ per tonne marketed, or $\$ 17$ per capita. As the table below shows, net annual recycling costs for the City are below average for its WDO municipal grouping. The costs for some of the municipalities in the Urban Regional municipal grouping are also presented for comparison purposes.

## 6. Planned Recycling System

### 6.1 Evaluation of Waste Recycling Best Practices

The City reviewed a number of options for consideration in its Waste Recycling Strategy based on proven best practices including those from KPMG Blue Box Program Enhancement and Best Practices Assessment Project (2007) and a review of practices in other municipalities. A summary of the options reviewed are provided below with more detailed provided in Section 6.2.

Table 5: Review of Best Blue Box Best Practices

| Status | Description of Options/Best Practices ${ }^{\text {a }}$ | Warrants Additional Attention? |
| :---: | :---: | :---: |
| Promotion and Outreach |  |  |
| Currently in use | Public Education and Promotion Program <br> Public education and promotion programs are crucial for ensuring the success of local recycling programs. Welldesigned and implemented education and promotion programs can have impacts throughout the municipal recycling program, including participation, collection, processing, and marketing of materials. Furthermore, having a P\&E plan contributes toward the amount of WDO funding a municipality receives as identified in best practice section of the WDO municipal datacall. For example, benefits of public education and promotion programs include: <br> - Greater participation levels and community involvement <br> - Higher diversion rates <br> - Less contamination in recovered materials, potentially leading to higher revenues <br> - Lower residue rates at recycling facilities <br> Stewardship Ontario has prepared a Recycling Program Promotion and Education Workbook and other materials, which are available on Stewardship Ontario's Recyclers' Knowledge Network <br> (http://www.stewardshipontario.ca/download/recycling-peworkbook/) | Yes <br> (Details are provided in Section 6.2.1) |

| Status | Description of Options/Best Practices ${ }^{\text {a }}$ | Warrants Additional Attention? |
| :---: | :---: | :---: |
| Currently in use | Training of Key Program Staff <br> A well-trained staff can lead to greater cost and time efficiencies and improved customer service. <br> Knowledgeable staff (including both front line staff and policy makers) have a greater understanding of their municipal programs and can perform their responsibilities more effectively. There are a number of low-cost training options available. The CIF holds periodic Ontario Recycler Workshops that discuss recycling program updates (http://cif.wdo.ca/events/orw/index.htm). The MWA, Waste Diversion Ontario (WDO), the association of Municipalities of Ontario (AMO), Stewardship Ontario and the Solid Waste Association of Ontario (SWANA) can also be sources of information guides, workshops, or training on recycling or solid waste management. | No <br> (Regular training of staff already occurs and will continue) |
| Collection |  |  |
| Currently in use | Optimization of Collection Operations <br> The purpose of optimizing collection operations is to collect more recyclables using fewer financial, capital and human resources. This requires critically assessing both collection and processing operations (as the two are closely linked) and making changes that reduce costs while at the same time increases capture of blue box materials. The relevant options for optimization vary according to the size, composition and location of municipalities, as well as their available processing options. | No <br> a) Contractor has final say on many collection aspects (e.g., trucks, routes) <br> b) Collection RFP based on CIF model contract; <br> c) detailed analysis of system previously completed |
| Currently in use | Established and Enforced Policies that Induce Waste Diversion <br> Non-monetary incentives like bag limits restrict the number of garbage bags a resident may dispose per collection. These restrictions encourage residents to divert more recyclables in order not to exceed the bag limit. <br> Bag limits can also be used in conjunction with bag tags (e.g., user fees). For example, some municipalities allow residents to dispose of a number of bags for free, with additional bags requiring a purchased bag tag. | Yes <br> a) Details are provided in Section 6.2.2 |

| Status | Description of Options/Best Practices ${ }^{\text {a }}$ | Warrants Additional Attention? |
| :---: | :---: | :---: |
| Currently in use | Enhancement of Recycling Depots <br> Where curbside collection programs are not feasible, recycling depots provide an inexpensive means for municipalities to divert recyclable materials from disposal. Enhancements to recycling depots may include (but are not limited to): <br> - Providing satellite depots to improve public access and convenience; <br> - Enhancing the conditions at the landfill depot (e.g., landscaping, general cleanliness, maintenance); <br> - Incorporating friendly, easy-to-read signage; Providing additional part-time staff to address seasonal fluctuations and visiting traffic. | No <br> a) Curbside/ Multiresidential collection available to all residents b) enhancements to existing depots already underway |
| Currently in use | Provision of Free Blue Boxes <br> Providing free blue boxes helps to ensure that residents have sufficient storage capacity for recyclables. While this is initially done at the roll-out of the blue box program, many municipalities offer free boxes to new residents or residents moving into new homes. Some municipalities also offer one extra free box or bin for residents per year. However, in municipalities offering only basic recycling services, one blue box container may be sufficient | Yes <br> a) Details are provided in Section 6.2.3 |
| Currently in use | Collection Frequency <br> The efficiency of curbside collection of recyclables is dependent on a number of factors, including the rural nature of the community, the types of recyclable materials included in the recycling program, the type of equipment used to collect the recyclables, among other things. In some circumstances, bi-weekly collection of recyclables can be more cost-effective than weekly collection, assuming that collected tonnages remain the same overall and residents have enough storage capacity to accommodate storing their blue box materials for two weeks. | No <br> a) see response to Optimization of Collection Operations b) curbside collection frequency is same as garbage |

| Status | Description of Options/Best Practices |  |
| :--- | :--- | :--- |
| Transfer and Processing <br> Currently <br> in use | Optimization of Processing Operations <br> Similar to the optimization of collection operations, the <br> purpose of optimizing processing operations is to process <br> more blue box materials for less cost. Processing <br> operations may be optimized either through upgrading or <br> maximizing the use of existing processing equipment, or <br> by partnering or contracting with processing facilities in <br> other communities. Because processing and collection <br> are directly linked, examination of one must be reviewed <br> with the other. | Warrants <br> Additional <br> Attention? |
| aptimization of <br> Collection <br> Operations |  |  |
| Currently <br> in use | Optimization of Materials Being Collected <br> The types of materials collected by London has increased <br> over the years with the most recent expansion in 2011 <br> when cardboard cans, more plastics (\#3, \#6, \#7 and \#1 <br> clamshells) and aerosol cans were added. Recyclable <br> materials not part of the City's program and collected by <br> other municipalities will be considered/analyzed for <br> addition on a regular basis. | No |
| a) Details are |  |  |
| provided in |  |  |
| Section 6.2.4 |  |  |

| Status | Description of Options/Best Practices ${ }^{\text {a }}$ | Warrants Additional Attention? |
| :---: | :---: | :---: |
| Additional Research |  |  |
| Currently in use | Assess Tools and Methods to Maximize Diversion Waste recycling programs fail or succeed based on their ability to overcome public barriers to participation. Additional research on the appropriate tools and methods can help how best to maximize opportunities to divert Blue Box materials from the waste stream and reduce waste going to disposal. Possible topics may include: <br> - The types of waste diversion behaviours currently undertaken in each household; <br> - Perceived barriers to participation in waste diversion programs; <br> - Willingness to participate in waste recycling programs; <br> - How residents receive information or learn about local waste recycling programs; <br> - The tools residents need to increase their participation in recycling programs. <br> This information can be collected through telephone surveys and focus groups. Methods and tools identified through the survey can be tested for performance using focus groups or through a pilot project. | Yes <br> a) Details are provided in Section 6.2.6 |
| Administration |  |  |
| Currently in use | Following Generally Accepted Principles for Effective Procurement and Contract Management <br> A considerable number of municipalities in Ontario contract out the collection and processing of recyclables. To ensure that municipalities obtain good value for money, municipalities should follow generally accepted principles (GAP) for effective procurement and contract management. Key aspects of GAP include planning the procurement well in advance, issuing clear RFPs, obtaining competitive bids, and including performancebased incentives. | No <br> a) Already follow GAP principles; collection, processing RFPs based on CIF model contract; processing contract has performance based incentives, etc. |

[^0]
### 6.2 Overview of Planned Initiatives

The City reviewed a number of options for consideration in this Waste Recycling Strategy and the following initiatives are being considered to improve overall waste diversion.

### 6.2.1. Public Education and Promotion Program

The following public education and promotion initiatives are proposed:

- Targeted promotion to increase the capture of boxboard, mixed household paper, plastics and aluminum foil/trays and proper sorting of recyclables
- Increase education and promotion funding (as budgets permit) and/or in-kind services to the recommended "Blue Box" best practice of \$1 per household to implement new incentive programs (e.g., reward programs such as the Gold Box) and/or other encouragement/engagement programs
- Continue to develop annual Public Education and Promotion plan

## Target Key Materials

Existing programs are the easiest place to find more materials to divert from landfill. Programs such as Blue Box recycling are already deep-rooted in our community. Residents understand the program and the program infrastructure is in place.

Waste audits conducted in 2012 show there are 11,000 tonnes of recyclable materials still being disposed of in the garbage. The incremental cost to capture more of these recyclables through the existing collection program is small compared to the cost to provide new programs.

The best way to increase the capture rate of missed recyclables is with enhanced communication and education and different methods of reaching the target audiences. This should focus on the key materials that have a combination of a low capture rate and significant quantity

| Table 6-Key Recyclable Materials to Target |  |  |
| :--- | ---: | ---: |
| Material | Existing <br> Capture <br> Rate | Quantity in <br> Garbage <br> (tonnes) |
| Boxboard | $60 \%$ | 1,900 |
| Household Paper | $40 \%$ | 1,700 |
| Plastic Containers | $60 \%$ | 1,600 |
| Aluminum Foil/Trays | $10 \%$ | 200 | still in the garbage.

Recommended materials to focus on are boxboard (e.g., cereal boxes), mixed household paper, plastics and aluminum foil and trays as shown in Table 6.

## Education and Promotion Funding

WDO best practices report recommends that a municipality spend approximately $\$ 1$ per household on promotion and education for recycling in addition to the free newspaper ads provided by industry. London's current budget is approximately $\$ 80,000$. At $\$ 1$ per household the budget would be approximately $\$ 170,000$. Given

## Existing Education/Promotion Program

$\checkmark$ Annual $\$ 70,000$ budget for recycling
$\checkmark$ Annual $\$ 30,000$ budget for other waste diversion programs
$\checkmark$ Newspaper ads provided without charge, as an in-kind industry stewardship obligation to pay for Blue Box program costs current budget constraints it is not practical to increase to this level in the short term, and alternative strategies will need to be identified. Staff will look at opportunities to increase exposure and awareness of our programs taking advantage of low and no cost media options. The additional funding can go towards promotion programs such as incentive programs.

## Annual Promotion and Eduction Plan

More and more each year staff is challenged to develop innovative and cost effective methods of communicating our program information and key messages to the London community. The traditional media outlets, such as newspaper, radio and television ads, which previously represented our main means of communicating, are now only one part of the much wider range of methods being used to inform and educate the public about our programs. The new media offer great opportunities to connect with more people. To help us meet these
 challenges and benefit from the wide range of media for getting our messages out to Londoners, an annual Promotion \& Education (P\&E) Plan is created to provide direction, key messages and budget allocations for the year.

In general, the goals of the public education and promotion are to:

- Increase participation levels
- Increase the capture rate of materials from participating residents
- Reduce the amount of contamination and cross contamination placed in recycling containers

The Sort it Right! Campaign was launched in late 2012 and has been the key focus for the Blue Box program through 2013 and will continue in 2014. The goal of the campaign is to minimize the amount of recycling errors (non-recyclables and recyclables placed in the wrong Blue Box) received at the MRF to less than $3 \%$ by the end of 2014. Providing positive feedback to the majority of London residents that take the time to recycle correctly is also a priority. Thank you cards are currently being used. Other options include curbside recognition of perfect recyclers through stickers on Blue Boxes, or awarding a special box, such as a gold box. The gold box program in Hamilton provides a gold recycling box to residents who have been found to be sorting their recyclables properly.

A second priority for 2014 will be public education in the multi-residential sector. While curbside households normally capture roughly $70 \%$ of their recyclable materials, multi-residential locations only manage to capture close to $30 \%$ of their total recyclable materials. While the main goal of additional P\&E programs may be to boost overall capture rates, effective $\mathrm{P} \& \mathrm{E}$ will also have positive effects across the recycling system from collection and processing, through to the final marketing of materials.

### 6.2.2. Established and Enforced Policies that Induce Waste Diversion

 Policy initiatives proposed are:- Additional investigation into reducing the bag limit in conjunction with a user pay system for "extra" curbside garbage

Other policy initiatives such as Full User Pay and Mandatory Recycling By-law (with and without clear bags for garbage) will not be considered at this time.

## Background

Although there are high levels of resident participation in the City diversion programs, participation is voluntary, and does not require residents to first minimize the quantity of waste being generated in the home. There are a number of "behaviour change initiatives" that could be undertaken to encourage both waste reduction (i.e., not produced in the first place) and waste diversion of recyclables and compostables. As waste diversion programs mature and all practical programs have been implemented, behaviour change initiatives become the key tools remaining to increase diversion.

Some of these programs are not costly to implement and may generate revenue (e.g., user pay for garbage) or reduce costs (e.g., every other week garbage collection). Other programs would require support by businesses and residents, and could range from tougher enforcement of waste by-laws (e.g., garbage container and weight limits) to City policies and by-laws that would impact how business is conducted and consumer behaviour (e.g., banning plastic bags in London). Some residents may see these programs as inconvenient or "going too far".

Below are some common behaviour change initiatives that may have a role in London in the future. Most of these initiatives will require a
 change to current Council policies and practices and be implemented through a by-law.

## Bag Limits

Reducing the container limit will encourage participation in the various waste diversion programs as well as reducing garbage generation.

The City of London currently has a 4 Container Limit for garbage collection for single family households. The City's container limit takes into consideration the longer cycle times between collections which varies from 8 to 12 days throughout the year. This is equivalent to 2.3 to 3.5 containers per week or an average of 3.2 containers per week over the entire year. Many Ontario municipalities have a one or two container limit per week.

Consideration to reducing the bag limit in conjunction with a user pay system for "extra" curbside garbage is recommended because:

- The quantity of curbside garbage per household has been reduced by $17 \%$ since the introduction of the 4 Container Limit in 2007
- Many municipalities have a 1 or 2 container limit
- Allowing residents to pay for "extra" garbage will provide convenience to residents who currently drive extra garbage to the EnviroDepots

Under the current six day cycle, consideration should be given to reducing the container limit to three containers per week with residents having the option of purchasing tags for additional containers.

Staff is currently examining various potential collection schedules, including a return to weekly garbage collection. If the City implements weekly garbage collection, consideration should be given to reducing the container limit to 2 bags per week with residents having the option of purchasing tags for additional containers.

## Collection Frequency

Reducing garbage collection frequency to every other week can result in an even greater desire to participate in waste diversion programs and reduce garbage generation. Municipalities with every other week garbage collection typically have weekly Green Bin collection which allows residents to get rid of materials that are likely to smell if stored for two weeks. Without a Green Bin program, it is possible to reduce collection to every other week in the winter when cooler weather can help control odours but not the summer. This type of collection schedule is called "seasonal collection" (weekly collection in the summer and biweekly collection in the winter).

Consideration should be given to a seasonal collection schedule as part of the City's review of potential collection schedules.

## Mandatory Recycling By-Law

The vast majority of Londoners participate in various diversion programs although there are those that refuse to participate in these voluntary programs. The City could explore developing a mandatory by-law for the diversion of materials for which there are programs. Enforcement of the by-law would require additional staff. Some municipalities have residents use clear bags so that recyclables could be easily spotted in the garbage. This is more common in the Maritimes but the City of Markham recently became the first large municipality in Ontario to require the use of clear bags.

Consideration to a mandatory recycling by-law and/or the use of clear bags should not be considered until other behavior change initiatives have been implemented.

## Full User Pay

Some smaller municipalities have gone to full user pay systems where residents pay for every container of garbage placed to the curb. Full user pay systems encourage participation in the various waste diversion programs as well as reducing one's garbage generation.

A full user pay system is typically not practical in larger municipalities unless the municipality has a cart based garbage collection system. This the case in Toronto where residents pay an annual fee ranging from $\$ 224$ to $\$ 430$ per year per household depending on the size of cart they select. A full user pay system is not recommended for London at this time.

### 6.2.3. Provision of Free Blue Boxes

The following initiatives are proposed to increase resident's capacity to store Blue Box materials:

- In 2014 provide residents of newly constructed homes with two Blue Boxes at no cost
- In 2014 establish a multi-residential recycling cart purchase program that sells roll-out carts at cost
- By 2015 begin selling Blue Boxes at cost from the City's EnviroDepots
- By 2015 provide front-end collection of cardboard at larger multi-residential buildings
- By 2016 to 2019, begin providing free replacement Blue Boxes for broken ones

## Blue Boxes

The City currently provides two free Blue Boxes to newly constructed homes. Consideration will be given to expand the program by providing replacement Blue Boxes at cost or for free. This will result in more boxes in the system which will increase the capacity to recycle and provide convenience for residents. Further benefits include:

- Improved ability of residents to sort recyclables into two streams
- More room to recycle more
- Improved litter control by reducing overflowing boxes and the use of other containers (e.g., cardboard boxes, laundry baskets, etc.) and broken Blue Boxes
- Increase access to recycling for those less able to purchase Blue Boxes
- Waste Diversion Ontario recognizes providing free or below cost recycling containers as a best practice and municipalities are financially rewarded in their funding grant
- Minimal cost to implement ; there is no added cost for selling Blue Boxes at cost and it would cost approximately $\$ 5,000$ per year to provide a second Blue Box to new homes

It is estimated that such a program could cost approximately $\$ 100,000$ per year but given the benefits above this expenditure may be warranted.

## Blue Carts

The Blue Cart is the standard container for recycling collection in multi-residential buildings. The benefits of making carts more accessible are similar to those of providing more Blue Boxes. More carts in the system will increase the capacity to recycle and provide convenience for residents. Some specific benefits include:

- Improved ability of residents to sort recyclables into two streams
- More capacity to recycle
- Improved building maintenance and litter control by reducing overflowing carts
- A lower price recycling container is an incentive for building owners/property managers to increase their recycling efforts and reduce their garbage

In 2010 the City received a grant from the Continuous Improvement Fund (Waste Diversion Ontario) to increase the number of recycling carts in our program. The goal of the grant program was to increase the number of carts to the best practices recommendation of 50 litres capacity per multi-residential unit (i.e., 1 cart per 7 units). London used the grant to subsidize the cost of carts for building owners and property managers. We continue to make subsidized carts available, and work towards the best practices recommended number of carts.

The following provides an overview of number of carts:

- Since 2009, prior to the grant program, we have increased the number of carts to from 25 litres to 38 litres per unit (our goal is 50 litres per unit).
- There are 5,350 recycling carts in the program (compared to 3,400 in 2009)

The original "subsidized" cart program is drawing to an end and given its success should be replaced with a permanent "at cost" cart program.

### 6.2.4. Optimization of Materials Being Collected

The following initiatives are proposed with respect to adding new materials to the Blue Box program:

- Add mixed polycoat (includes hot/cold beverage cups \& ice cream containers) and blister packaging (i.e., consumer plastic packaging such as rigid plastic around toys, hardware, etc.) beginning October 2014 with the new Waste Reduction and Conservation calendar
- Investigate metal cookware and single use batteries in 2016 to 2019 noting these designated materials and do not receive funding

It is proposed to not consider adding film plastic (e.g., plastic bags) or expanded foam polystyrene (EPS) at this time.

## Background

The existing Blue Box program already includes all "low hanging fruit". These are materials that can be managed at a reasonable cost or materials that constitute a large portion of the waste stream.

A review of other municipalities in Ontario found nine "more difficult" to recycle materials that are being recycled by at least one municipality. Financial, environmental and social considerations as well as technical issues of adding these materials to the City's recycling program are presented in Appendix F and summarized below.

Materials That May be Added in the Short Term
Further investigation in the short term is recommended for mixed polycoat (e.g., coffee cups) and blister packaging (rigid plastic around toys, hardware, etc.).

Each of these materials is currently being recycled by one or more municipalities in Ontario but research is required to confirm strength of end markets and processing costs for addition to the City's program in 2014.

Materials That May be Added in the Mid-Term
Further investigation in the mid-term is recommended for batteries and metal cookware.

Mixed Polycoat

Single Use Batteries

Blister Packaging

Metal Cookware

Each of these materials is currently being recycled by one or more municipalities in Ontario but research is required to:

- Further examine alternative collection methods for single use batteries (e.g., collection with Blue Box or separate collection with electronics)
- Confirm processing costs and changes to the City's Material Recovery Facility to accommodate metal cookware in the future

Materials not to be Added at this Time

Film Plastic

Expanded Foam

Textiles

Film plastic (e.g. plastic bags), expanded foam polystyrene (EPS) and textiles are not recommended for inclusion in the recycling program at this time because:

- Potential to contaminate other recyclables and/or damage processing equipment
- Processing costs are significantly greater than revenue
- Residents can already take film plastic (e.g., grocery bags) to many retail outlets for recycling and textiles to drop-off locations throughout the City for reuse
- EPS does not have stable North American markets and its capture rate is very low (<20\%) at Material Recovery Facilities

Consideration will be given to collecting film and EPS at the EnviroDepots as part of a pilot project.
6.2.5. Multi-Municipal Collection and Processing of Recyclables

The following initiatives are proposed with respect to multi-municipal collection and processing of recyclables:

- London will continue to seek additional municipal partners to use its Manning Drive Material Recovery Facility to process their Blue Box recyclables

## Background

The Manning Drive MRF opened in August 2011 servicing the City of London which generates approximately of 26,000 tonnes of Blue Box recyclables per year. Since opening, nine other municipalities/organizations have started to use the new MRF. These municipalities/organizations are Alymer, Bayham, Central Elgin, Dutton-Dunwich, Malahide, Thames Centre, St. Thomas, Waste Management (Commercial Recyclables) and Western University. The MRF now generates approximately 33,000 to 34,000 tonnes per year of materials for end markets.

The City contracts out the operation of the MRF. The per tonne processing fee paid to the contractor varied based on the quality of material, whether or not Blue Bags are allowed and the quantity of material processed. As more materials is processed, the per tonne processing fee is lowered.

It is estimated that the City will save approximately $\$ 450,000$ to $\$ 500,000$ annually in reduced processing fees because of the additional material being processed from other municipalities. The other municipalities using the facility also benefit from the lower per tonne processing fees.

## Potential Future Savings

The per tonne processing fee paid to the contractor will continue to drop until the facility is processing over 40,000 tonnes per year. If this annual rate is achieved London will save a further $\$ 200,000$ per year. The other municipalities using the MRF will also save addition funds.

London will continue to seek additional municipalities to use the Manning Drive MRF in order to reduce processing costs. London will seek "partner" municipalities whose pricing varies (like London) as well as bid on RPPs and tenders for those municipalities who want to have a fixed price. The Municipality of West Elgin is scheduled to start using the facility in 2015 as a partner municipality. They City will be responding to directly or as a subcontractor to the Oxford County ( 4,000 tonnes) RFP that is scheduled to be released in the Fall 2014.
6.2.6. Standardized Service Levels and Collaborative Haulage Contracting The following initiative with respect to standardized service levels:

- Continue to standard services and promotion/education across all municipalities using the London MRF

## Background

In 2012 London signed partnership agreements with six local municipalities for processing of Blue Box recyclables at the Manning Drive Regional Material Recovery Facility (MRF). At that time the partner municipalities (Aylmer, Bayham, Central Elgin, Dutton-Dunwich, Malahide, Thames Centre), changed their programs to collect the same as in London's program. This harmonization of Blue Box programs across the seven municipalities has offered considerable shared benefits. For residents the immediate benefit is common information about their recycling program across all partner municipalities. As residents travel across the communities (for work, school, entertainment, etc.) they will access this common information about their recycling program from the various local media (TV, radio, news and community papers) and in social interactions (e.g., from friends and family living in adjacent communities). For municipalities there is savings of P\&E budgets and staff time as all are able to share in design templates and work cooperatively on media buy and production costs.

Building regional MRF partnerships was a key focus for 2013 and will continue through 2014 as we explore ways to promote common messages and share resources. Community partnerships have been fostered in new areas including working with youth groups, a local theatre company and community organizations.

St. Thomas began using the Manning Driver MRF in March 2014 and has aligned its Blue Box program with the other municipalities using the Manning Drive MRF. We expected St. Thomas to also join London and the other municipalities using the MRF in providing common messaging and sharing resources.

### 6.2.7. Assess Tools and Methods to Maximize Diversion

City staff will continue to examine public barriers to participation. Additional research on how best to maximize opportunities to divert Blue Box materials from the waste stream and reduce waste going to disposal will be undertaken as required and resources are available. Possible topics may include:

- The types of waste diversion behaviours currently undertaken in each household
- Perceived barriers to participation in waste diversion programs
- How residents receive information or learn about local waste recycling programs
- The tools residents need to increase their participation in recycling programs

This information can be collected through telephone surveys and focus groups.

## 7. Monitoring and Reporting

The monitoring and reporting of the City's recycling program is considered a Blue Box program fundamental best practice and will be a key component of this Waste Recycling Strategy. The City of London currently monitors many aspects of its Blue Box program as outlined in the table below.

|  | Table 7 - Recycling System Monitoring |  |
| :--- | :--- | :--- |
| Monitoring Topic | Monitoring Tool | Frequency |
| Total Waste <br> Generated | Measuring of garbage, recyclables <br> and waste reduction measures <br> following the rules of the GAP <br> DataCall | Annually |
| Overall Diversion <br> Rate | Formula \{(Blue Box materials + <br> other diversion) / Total Waste <br> Generated\} following the rules of <br> the GAP DataCall | Annually |
| Total Blue Box <br> Recyclables <br> Collected | Weight and volume of Blue Box <br> material collected. Weight is <br> based on weigh scale data. <br> Volume is an estimate based on <br> assumed density of the individual <br> materials | Weight - monthly <br> Volume - annually |
| Blue Box <br> Recyclables in <br> Residue | Composition audit of material <br> being shipped to landfill; | Six to ten times per year |
| Blue Box <br> Contamination and <br> Cross Contamination | Composition audit of material <br> being shipped to landfill plus audit <br> MRF data | Three to six times per year |
| Blue Box <br> Recyclables in <br> Garbage | Composition audit of material in <br> Blue Box and Garbage | Every five to six years in <br> conjunction with review of <br> Waste Recycling Strategy |
| Opportunities for <br> Customer <br> Improvement | Tracking calls/complaints received <br> to the municipal office | On-going |
| Program <br> Participation | Monitoring of curbside set out <br> rates | Every one to three years |

|  | Table 7-Recycling System Monitoring |  |
| :--- | :--- | :--- |
| Monitoring Topic | Monitoring Tool | Frequency |
| Review of Waste <br> Recycling Strategy | A periodic review of the Waste <br> Recycling Strategy to monitor and <br> report on progress, to ensure that <br> the selected initiatives and <br> programs are being implemented <br> and to move forward with <br> continuous improvement. | Every five to six years |

The current monitoring of the City's Blue Box recycling program is considered sufficient and no additional monitoring is recommended at this time. The monitoring of the systems allows comparison against the baseline established for the current system. Once the results are measured, they will be reported to Council and the public.

## 8. Conclusion

The City of London's Waste Management System is based on a Continuous Improvement Strategy (management philosophy) and Sustainable Waste Management. This strategy, which was approved by Municipal Council in 1997, has been the foundation for going forward. It uses an active framework that recognizes integrated waste management as an important environmental service in the community. By effectively allocating financial and human resources, this environmental service contributes to the protection of human health and the environment. By supporting an integrated system of waste reduction (i.e., not producing waste in the first place), recovery of materials that can be recycled and composted, and ensuring that what remains is handled in an environmentally responsible manner, this strategy provides the mechanism for continuous improvement of the waste management system. Since this strategy was approved over fifteen years ago, the City of London has steadily increased its performance to the current level of $44 \%$ waste diversion while having one of the lowest total waste management costs in Ontario for urban centres (based on statistics compiled by the Ontario Municipal Benchmarking Initiative - OMBI).

This Waste Recycling Strategy lay the framework for improvements in the City's recycling program over the next few years. This Waste Recycling Strategy included the compilation of baseline data via curbside waste audits, tonnage summaries, staff reports, public consultation and examination of programs in other communities. An increase in the capture rates of specific recyclable materials, an overall increase in capture rates for recyclables and enhancing
service and value to the residents of London are the main objectives of this document. In order to achieve the objectives outlined in the strategy, several initiatives will be implemented over the next few years, including:

- Targeted promotion to increase the capture of boxboard, mixed household paper, plastics and aluminum foil/trays and proper sorting of recyclables
- Increase education and promotion funding (as budgets permit) and/or in-kind services to the recommended "Blue Box" best practice of \$1 per household to implement new incentive programs (e.g., reward programs such as the Gold Box) and/or other encouragement/engagement programs
- Continue to develop annual Public Education and Promotion plan
- Additional investigation into reducing the bag limit in conjunction with a user pay system for "extra" curbside garbage
- Provide residents of newly constructed homes with two Blue Boxes at no cost
- Establish a multi-residential recycling cart purchase program that sells roll-out carts at cost
- By 2015 begin selling Blue Boxes at cost from the City's EnviroDepots
- By 2015 provide front-end collection of cardboard at larger multi-residential buildings
- By 2016 to 2019, begin providing free replacement Blue Boxes for broken ones
- Add mixed polycoat (includes hot/cold beverage cups \& ice cream containers) and blister packaging (i.e. consumer plastic packaging such as rigid plastic around toys, hardware, etc.) beginning October 2014 with the new Waste Reduction and Conservation calendar
- Investigate metal cookware and single use batteries in 2016 to 2019 noting these designated materials and do not receive funding
- Continue to seek additional municipal partners to use its Manning Drive Material Recovery Facility to process their Blue Box recyclables
- Continue to standard services and promotion/education across all municipalities using the London MRF

As this Waste Recycling Strategy is a living document, monitoring and reporting of the implementation tools listed above will be ongoing throughout the life of the document. The evaluation tools include conducting curbside waste audits, monthly monitoring of tonnage reports for recyclables being shipped from the MRF and monitoring of inquiries to the City's Customer Service Unit.

## APPENDIX A <br> Public Consultation Program

The following appendix summarizes public consultation on ROAD MAP 2.0 The Road to Increased Resource Recovery and Zero Waste. This document examined all facets of improving waste diversion including the Blue Box Program.

Community Events and Outreach Displays

| Location | Type | Duration |
| :---: | :---: | :---: |

You are invited to provide your opinion on London's draft plan for future recycling, composting (organics) and garbage programs.

Full Report available at City Hall and Iondon.ca

Road Map 2.0: The Road Map to Increased Resource Recovery \& Zero Waste The City of London needs your help to identify how we can further reduce the amount of waste we send to landfill. We have produced a report called Road Map 2.0: The Road to Increased Resource Recovery \& Zero Waste. This overview of the Report highlights key information we seek your input on.

## Where Have We Been Since 2007? (Road Map)

In 2007 we released our first Road Map and with your input set a course for what we wanted to achieve. Let's review what has been accomplished and then look at our options for the future.

Our Key Accomplishments since 2007

35,000 Blue Bags \& 1,900 Subsidized Blue Carts to Condo/Apartment Buildings

Green Bin Pilot Project
One Year Green Bin and Modified Garbage Collection Pilot Project

Historical look at London's waste diversion: The percentage that does not go to landfill

1990 - Curbside Blue Box program started 1995 - More added to the Blue Box 1996 - Yard material collection started 2000 - Condo/apartment building recycling started
2003 - Public space recycling started 2005 - 4 container garbage limit started 2009 - More added to the Blue Box 2011 - More added to the Blue Box

The full Road Map 2.0 report is available from City Hall or Iondon. calenvironment. space provided through a partnership between industry and Ontario municipalities to support waste diversion programs.

## What's Left in the Garbage Bag?

Most of what we put in the garbage could be considered a resource and therefore should be diverted from the landfill. The pie charts below show just how much could be diverted - whether you put your garbage out to the curb, or down the chute into a garbage bin (2012 data). Increased diversion will have a social and financial impact, as well as environmental, so all factors will be considered.

## Reducing the Amount of Garbage Sent to Landfill. What are Some of the Choices?

## 1 Blue Box Recycling

Here are some options for increasing how much we recycle:

- Accept more materials in the Blue Box: - coffee cups and ice cream containers - plastic 'blister packaging' (the hard-toremove) clear plastic on toys and tools batteries and metal pots \& pans
- Provide more recycling containers.
- More opportunities to recycle away from home, such as in public spaces and businesses.

## 3 EnviroDepots

The EnviroDepots are popular destinations which provide a convenient 'one stop drop-off' for many materials. Options for increasing their effectiveness include:

- Open a North-end Depot
to complement our depots in the East, West and South ends
- Accept more materials for recycling:
paint
Styrofoam ${ }^{\text {TM }}$
carpets and mattresses

## 2 Organics Management

- Home Composting

Home composting has played an important role in waste reduction in London. It is estimated that 500 to 2,000 more tonnes of food scraps could be diverted from landfill.

- Community Composting

Community composting is now possible due to recent changes to provincial legislation.

- Christmas Trees

Provide curbside collection for composting.

- Green Bin Program

A decision about a Green Bin program has been delayed until a more comprehensive review of other options has been completed.

## 4 <br> Encouraging \& Engaging Londoners

There are a number of initiatives that could be undertaken to encourage both waste reduction (i.e. not produced in the first place) and waste diversion of recyclables and compostables.
Options include:

- decreasing the garbage bag limit
- more awareness and feedback to residents
- user pay system for extra bags
- reducing the frequency of garbage collection
- incentive programs to increase recycling
- mandatory recycling by-law

The full Road Map 2.0 report is available from City Hall or london.calenvironment. Space provided through a partnership between industry and Ontario municipalities to support waste diversion programs.

## What Technologies Should We Look at to Help Reduce Waste?

There are various technologies that could assist in optimizing materials recovery and creating renewable energy while moving from the City's current diversion rate of approximately $44 \%$ towards the Provincial goal of $60 \%$ and beyond.
Approximate Costs for Alternative Technologies and Conventional Technologies

Anaerobic Digestion generally for separated organic matter
$\$ 70$ to $\$ 120$
Energy-from-Waste (advanced combustion and energy recovery)
\$100 to \$150
Advanced Thermal Treatment (produces charcoal, coke or gas)
$\$ 80$ to $\$ 155$
Mechanical Biological Treatment (MBT) Examples include a combination of
$\$ 90$ to $\$ 150$
mechanical material sorting followed by composting, anaerobic digestion or bio-drying
Estimated Processing Cost per Toane ibl
Conventional Technologies
Aerobic Composting Examples include covered vindrows, channel,
in-vessel, silos, rotary drums
Landfilling (c) $\$ 30$ to $\$ 45$
(a) Same technologes requice a separated streamn of materials cthers handle miwd waste.
b) Estimsted fectinology cast ranges inclute aumul operaing costs and arrxasived capiaf coosts. Fowomue strama from product sidos ame not inctuded.
Generaly af new, emerging and nest generation technologies hawe sorme refance on landfiling Thin obet not indude potemid asharertents to landit tedmology.

## Understanding Financial Considerations

Approximately $65 \%$ of total waste management costs are paid by property taxes and $35 \%$ comes from recyding revenues, service fees and stewardship funding from industry. In 2013, it cost Londoners $\$ 5$ million ( $\$ 30$ per household) to serve 170,000 households with our existing waste diversion programs. Below we consider what programs will increase our diversion rate and at what costs.

| Diversion rate and level of program changes that are required | 40-45\% | 45-50\% | 50-60\% | 60-80\% |
| :---: | :---: | :---: | :---: | :---: |
|  | Minor Changes | More Changes | Major Changes | Significant Changes |
|  | Recycling improvements | Recycling \& composting improvements | New technology for organics | New technology for remaining waste |
| Diversion Rate: percent of waste diverted from landfill |  |  |  |  |
| $\begin{aligned} & \text { Green = dnerted } \\ & \text { Yellow = landfilled } \end{aligned}$ |  |  |  |  |
| Estimated cost range to achieve diversion rate | $\begin{aligned} & \$ 60,000 \text { to } \\ & \$ 120,000 \end{aligned}$ | $\begin{aligned} & \$ 800,000 \text { to } \\ & \$ 1,000,000 \end{aligned}$ | $\begin{aligned} & \$ 3,800,000 \text { to } \\ & \$ 5,000,000 \end{aligned}$ | $\begin{aligned} & \$ 6,000,000 \text { to } \\ & \$ 10,000,000 \end{aligned}$ |
| Additional cost at the household level | \$0.35-50.70 | \$5-\$6 | \$23-529 | \$35-\$60 |
| Total waste diversion cost per household | \$30-\$31 | \$35-\$36 | \$53-\$59 | \$65-\$90 |

## What is Your Opinion on the Recycling and Garbage Collection Schedule? Do you want more pick-ups?

| Options | How it would work? | Number of Collections per year | Additional Annual Cost | Additional Cost per Household Served |
| :---: | :---: | :---: | :---: | :---: |
| Current Schedule | No change - Collection once every 6 business days | 42 | \$0 | S0 |
| Seasonal Change | Collection on the same day Garbage is weekly in summer, bi-weekly in vinter. Recycling is weekly. | 39 - garbage <br> 52 - recycling | $\begin{aligned} & \$ 700,000 \text { to } \\ & \$ 1,000,000 \end{aligned}$ | \$7 |
| 5 Days | Collection ance every 5 business days The collection day moves forvard after a statutory holiday | 50 | $\begin{aligned} & \$ 700,000 \text { to } \\ & \$ 900,000 \end{aligned}$ | \$7 |
| Same Day | Same day collection every week | 52 | $\begin{aligned} & \$ 1,100,000 \text { to } \\ & \$ 1,300,000 \end{aligned}$ | \$10 |

We need to hear from you! See the next page for how to have your say.
space provided through a partnership between industry and Ontario municipalities to support waste diversion programs.

## Recycling and Resource Recovery Help Reduce Energy Use and Reduce Greenhouse Gas Emissions

Most of us know that recycling, composting and reducing the amount of waste we send to landfill is better for the environment. What you might not know is that making cans and newspapers from raw materials like minerals and trees takes far more energy than recycling old cans and newspapers. Plus, a lot of these smelters and paper mills are far away in Northern Ontario or Quebec, while recycling plants are closer to home. Less energy = fewer greenhouse gases. It also means that less land needs to be mined or forests felled for raw materials.

When food scraps and other compostable organic matter are sent to landfills, they produce methane (a potent greenhouse gas) as these materials decompose. By composting or reducing organic matter sent to landfill through alternative resource recovery technologies (see previous page) we can reduce greenhouse gas emissions. In fact, we are also able to make biofuels and other products from some of these technologies!

## How to Reduce our Waste

|  | - All of the Above | 22 | 0 |  |

## APPENDIX B <br> Community Characteristics

## Summary

Based on City of London Planning documents, in 2012 London had a total population of 387,690 ; this represents a $3.9 \%$ increase from the 2007 population of 373,310 . When compared to Canadian Census data for the period between 2006 and 2011, this growth was lower than the Ontario average population increase of $5.7 \%$.

The population projections for the City of London we're based on estimates contained in the report Employment, Population, Housing and Non-Residential Construction Projections, City of London, Ontario, 2011 Update prepared by the Altus Group in 2012 for the City of London. The update report provides population estimates for the years 2016, 2021, 2026, 2031, 2021, 2036 and 2041.

These population estimates were used to develop permanent population projections for the period 2013 to 2043 . For the period 2014 to 2041, the report's estimates were used for the years that a population estimate existed. For other years, the population was estimated by interpolation. For the period 2042 to 2043, it was assumed the rate of population growth would be the same as the period 2036 to 2041.

Seasonal population projections were developed to account for the large number of out of town students living off campus and attending UWO and Fanshawe College. The growth in the number of students was assumed to match the growth in permanent population.

The population projections for City of London for the period 2013 to 2043 are presented in Table B-3

Table B-1 City of London Historical Population

| Year | London $^{1}$ | Westminister $^{2}$ | Seasonal $^{3}$ | Total |
| :---: | :---: | :---: | :---: | :---: |

Notes

1. From City of London Planning Department documents.
2. Population includes the Township of Westminster prior to 1993. In 1993 the Township of Westminster became part of the City of London.
3. Equivalent seasonal population (students) is calculated in Table A-2.

Table B-2 City of London Seasonal Student Population

| Year | Enrollment ${ }^{1}$ |  | Equivalent Population |  | Total Equivalent Population ${ }^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | UWO | Fanshawe | UWO | Fanshawe |  |
| 1977 | 18,000 | 5,400 | 8,320 | 1,600 | 9,920 |

| 1998 | 23,250 | 10,000 | 10,740 | 2,970 | 13,710 |
| 1999 | 23,500 | 10,500 | 10,860 | 3,120 | 13,980 |
| 2000 | 23,750 | 10,600 | 10,970 | 3,150 | 14,120 |
| 2001 | 24,000 | 10,900 | 11,090 | 3,240 | 14,330 |
| 2002 | 26,000 | 12,200 | 12,010 | 3,620 | 15,630 |
| 2003 | 28,000 | 12,800 | 12,940 | 3,800 | 16,740 |
| 2004 | 29,000 | 13,200 | 13,400 | 3,920 | 17,320 |
| 2005 | 29,300 | 13,800 | 13,540 | 4,100 | 17,640 |
| 2006 | 29,600 | 14,200 | 13,680 | 4,220 | 17,900 |
| 2007 | 29,900 | 14,800 | 13,810 | 4,400 | 18,210 |
| 2008 | 30,200 | 15,500 | 13,950 | 4,600 | 18,550 |
| 2009 | 30,900 | 15,880 | 14,280 | 4,720 | 19,000 |
| 2010 | 31,600 | 16,260 | 14,600 | 4,830 | 19,430 |
| 2011 | 32,300 | 16,650 | 14,920 | 4,950 | 19,870 |
| 2012 | 33,000 | 16,970 | 15,250 | 5,040 | 20,290 |

1. Enrollment from UWO and Fanshawe registry up to 2008. Assumed to grow at same rate of population growth after 2008.
2. The equivalent population was calculated using the following assumptions: a) $70 \%$ of UWO students are from out of town and live off campus; b) $45 \%$ of Fanshawe students are from out of town and lived off campus and d) they lived in London for 8 months or $66 \%$ of the year. Estimates of the percentage of students living off campus are based on information provided by the UWO Housing Office.

Table B-3 Population Projections for the City of London

| Year | Permanent ${ }^{1,2}$ | Equivalent Seasonal ${ }^{3,4}$ | Total |
| :---: | :---: | :---: | :---: |
| 2013 | 368,700 | 20,300 | 389,000 |
| 2014 | 370,000 | 20,400 | 390,400 |
| 2015 | 371,300 | 20,500 | 391,800 |
| 2016 | 372,700 | 20,600 | 393,300 |
| 2017 | 375,200 | 20,700 | 395,900 |
| 2018 | 377,700 | 20,800 | 398,500 |
| 2019 | 380,200 | 21,000 | 401,200 |
| 2020 | 382,700 | 21,100 | 403,800 |
| 2021 | 385,400 | 21,300 | 406,700 |
| 2022 | 389,500 | 21,500 | 411,000 |
| 2023 | 393,600 | 21,700 | 415,300 |
| 2024 | 397,700 | 21,900 | 419,600 |
| 2025 | 401,800 | 22,200 | 424,000 |
| 2026 | 405,700 | 22,400 | 428,100 |
| 2027 | 408,900 | 22,600 | 431,500 |
| 2028 | 412,100 | 22,700 | 434,800 |
| 2029 | 415,300 | 22,900 | 438,200 |
| 2030 | 418,500 | 23,100 | 441,600 |
| 2031 | 421,900 | 23,300 | 445,200 |
| 2032 | 425,500 | 23,500 | 449,000 |
| 2033 | 429,100 | 23,700 | 452,800 |
| 2034 | 432,700 | 23,900 | 456,600 |
| 2035 | 436,300 | 24,100 | 460,400 |
| 2036 | 439,800 | 24,300 | 464,100 |
| 2037 | 443,400 | 24,500 | 467,900 |
| 2038 | 447,000 | 24,700 | 471,700 |
| 2039 | 450,600 | 24,900 | 475,500 |
| 2040 | 454,200 | 25,100 | 479,300 |
| 2041 | 457,600 | 25,200 | 482,800 |
| 2042 | 461,300 | 25,400 | 486,700 |
| 2043 | 465,000 | 25,600 | 490,600 |

Notes

1. Population projections for the period 2006 to 2041 based on Employment, Population, Housing and NonResidential Construction Projections, City of London, Ontario, 2011 Update (Altus Group,2012).
2. Population projections beyond 2041 were extrapolated by assuming the same rate of growth rate after 2041 as immediately prior to 2041.
3. Equivalent seasonal population (students) is calculated assuming $66 \%$ of students enrolled in post-secondary education are out of town students living off-campus for eight months of the year. Therefore each actual student represents $44 \%$ "equivalent" garbage of a permanent resident.
4. Growth in post-secondary enrollment is assumed to match population growth.

## APPENDIX C Historical Waste Generation and Diversion

## APPENDIX D

## Garbage and Blue Box Composition Data

## Existing Composition - Garbage (including compostables) and Blue Box Recyclables

Composition audits of garbage and Blue Box recyclables were conducted in London in 2012/2013 (with funding, coordination and sampling methodology provided by Stewardship Ontario). The audit consisted of four separate sets of audits conducted at specified intervals throughout the year (i.e. spring, summer, fall, winter) to address any issues of seasonality. Each audit included two samples taken over two consecutive collections to address issues of sporadic set out. The audit sample consisted of 100 curbside homes to achieve statistical significance. The same homes were used for each of the four sets of audits.

The audit data was combined with other City data (quantities of garbage and Blue Box recyclables collected from single family homes and multi-residential, multi-residential waste and blue box audits from 2007, etc.) to create the following tables:

- Table D1 - Summary of 2012 Garbage Composition
- Table D2 - Estimated 2012 Curbside Garbage and Recycling Composition
- Table D3 - Estimated 2012 Multi-Residential Garbage and Recycling Composition
- Table D4 - Estimated 2012 Garbage and Recycling Composition

## Future Composition - Waste (Garbage and Blue Box Materials Combined)

Estimates of waste quantities (garbage and blue box materials combined) were calculated for 2012, 2016 and 2025 and are shown in tables:

- Table D5 - Estimated 2012 Curbside and Multi-Residential Waste Composition
- Table D6 - Estimated 2016 Curbside and Multi-Residential Waste Composition
- Table D7 - Estimated 2025 Curbside and Multi-Residential Waste Composition These estimates were made taking the 2012 waste composition and adjusting it based on:
- estimates of future curbside (single family dwellings) and multi-residential units from Employment, Population, Housing and Non-Residential Construction Projects, City of London, Ontario, 2011 Update (AltusGroup, 2012)
- expected changes to the generation rate of specific materials using information on projected changes to the generation rates from Volume 1: Executive Summary $A$ Study of the Optimization of the Blue Box Material Processing System in Ontario Final Report (Waste Diversion Organization, 2012) (Table D8)

The changes to material generation rates in Table D7 are due to industry introducing new packaging or modifying existing packaging, changing consumer habits and new products being introduced. Examples of recent changes include:

- More fruits and vegetables in "clamshell" packaging
- An increase in light weight and multi material packaging
- Plastic containers replacing glass, aluminum and steel
- An increase in plastic stand-up pouches for food products
- Consumers reading more newspapers and magazines online which reduces the amount of paper for recycling
- An increase in cardboard as more people shop online

## Future Composition - Garbage and Blue Box Materials

Projections of the amount of material that would be diverted by the Blue Box program in the future were estimated for three scenarios:

- Table D9 - Estimated 2016 Garbage and Blue Box Composition - Base Case
- Table D10 - Estimated 2025 Garbage and Blue Box Composition - Base Case
- Table D11 - Estimated 2025 Garbage and Blue Box Composition - High Increase in Capture Rate
The composition in Table D9 is based on the implementation of the recommendations in this report. The composition in Table D10 assumes the increased capture rates continues in line with trends from previous years, but there are no substantially new or different initiatives to increase recovery. It is assumed that markets for some materials will strengthen based on current efforts. The composition in Table D11 assumes recovery rates are substantial and will require aggressive promotion, education and incentive programs (e.g., rewards programs for recycling).

The capture rates used to generate Tables D9 to D11 are presented in Table D12.

Table D1: Summary of 2012 Garbage Composition

| Material Category | 2012 |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

# Figure E-1-2012 Waste Diversion 

## Blue Box Recycling Programs

Curbside Recycling - 22,960 tonnes
The City collects a wide range of recyclables from all curbside households. The materials collected in 2012 were newsprint \& flyers; household paper; magazines, catalogues \& books; paper egg cartons \& boxes; cardboard boxes; glass bottles \& jars; aluminum food \& beverage cans; steel food \& beverage cans; foil containers \& foil; empty metal paint cans; empty aerosol cans; plastic bottles, jugs\& tubs; milk \& juice cartons; drink boxes \& cardboard cans. Plastic plant pots/trays and large plastic pails were added to the program in 2013.

Materials collected were taken to the City's Manning Drive Regional Material Recovery Facility (MRF) for processing and subsequent shipping to various end markets. This facility also receives recyclables form other City programs and other municipalities. Material is weighed upon entering and leaving the MRF.

Approximately 99\% of incoming recyclable materials (or 96\% of the total incoming material) was shipped to end markets in 2012. A portion of this material is allotted to each program (curbside, multi-residential, other municipalities) equal to the percentage of incoming recyclables from each source.

## Multi-Residential Recycling - 3,290 tonnes

The City collects recyclables from multi-residential buildings at no cost.
The property owner is responsible for purchasing and providing 95 gallon carts for residents to place their recyclables in. As a result, a few multi-residential buildings do not have recycling because the property owner has not provided carts. In 2012, 47,870 multi-residential units had access to on-site recycling and 3,830 units did not. Residents from buildings without on-site recycling must take their recyclables to one of three City EnviroDepots. City staff have made numerous attempts to further reduce the number of units without on-site access to recycling. Enforcement for this service lies with the Ministry of the Environment.

The materials collected, how they are processed and calculation of the quantity recycled is the same as the curbside Blue Box program.

## Depot Recycling - 370 tonnes

As noted above, the City operates three EnviroDepots (Oxford Street, Clarke Road and W12A Landfill) that accept a range of materials including Blue Box recyclables. The Blue Box materials collected, how they are processed and calculation of the quantity recycled is the same as the curbside Blue Box program.

## Public Space Recycling - 50 tonnes

The City has 42 EnviroBins located throughout the Downtown, Old East Village, Richmond Row and Wortley Village, for use by the residents when they are out shopping or going to restaurants and/or for the residents that live above some commercial establishments. Each EnviroBin has three compartments: containers, paper and garbage. The Blue Box materials accepted is the same as the curbside Blue Box program.

## Organic Programs

## Home Composting- 5,460 tonnes

The City sells composters at cost at its Oxford Street and Clarke Road EnviroDepots. In the 1990's the City also sold composters at "truck load sale events". Over the years the City has sold 54,600 composters including 240 in 2012. The Manual on Generally Accepted Principles (GAP) for Calculating Municipal Solid Waste System Flow recommends that municipalities assume each composter sold diverts 100 kilograms per year.

## Grasscycling - 5,460 tonnes

The City stopped collecting grass clippings in 1995 and started promoting grasscycling. Grasscycling refers to leaving grass clippings on the lawn when mowing.

Because grass consists largely of water ( $80 \%$ or more), contains little lignin, and has high nitrogen content, grass clippings easily break down and return to the soil within one to two weeks, acting primarily as a fertilizer supplement and, to a much smaller degree, a mulch. Grasscycling can provide $15-20 \%$ or more of a lawn's yearly nitrogen requirements.

It is estimated that not collecting grass diverts on average approximately 45 kilograms of grass per curbside household.

## Curbside Yard Material Collection - 4,540 tonnes

The City provides curbside collection of yard materials. This includes plant trimmings, brush and branches up to 10 cm in diameter. In 2012 yard materials were collected on a six week cycle and each home received four collections.

The collected yard materials are transported to TRY Recycling's composting facility for processing. The incoming material is weighted. On average about five percent of the incoming material becomes process residuals and $95 \%$ is either consumed during the composting process or is made into compost and sold. In 2012 4,540 tonnes of yard materials were collected curbside of which approximately 200 tonnes would become process residuals.

## Curbside Fall Leaf Collection - 4,680 tonnes

The City provides curbside collection of fall leaves beginning in mid-October. Yard materials are also collected with the fall leaves. In 2012 fall leaves were collected on a three week cycle and each home received three collections.

The collected yard materials are transported to TRY Recycling's composting facility for processing. On average about $5 \%$ of incoming material becomes residue. How they are processed and the calculation of the quantity composted is the same as for yard materials.

## Depot Yard Material Collection - 9,920 tonnes

Residents can drop off yard materials at the City EnviroDepots year round. The collected yard materials are transported to TRY Recycling's composting facility for processing. How they are processed and the calculation of the quantity composted is the same as for yard materials.

## Depot Christmas Tree Collection - 120 tones

The City operates depots at six locations to collect Christmas trees for the $1^{\text {st }}$ week of January each year. The trees are chipped on-site at the Depot locations and taken to TRY Recycling where they are chipped and composted and to W12A Landfill where they are chipped and used for daily cover.

## Other Programs

## Waste Electronics and Electrical Equipment Recycling - 1,130 tonnes

Waste Electronics and Electrical Equipment (WEEE) recycling is made up of three components. The first component is electronics collected at the EnviroDepots and shipped for recycling. In 2012 the EnviroDepots collected 560 tonnes of material electronics were shipped through the Ontario Electronic Stewardship (OES) program.

The second component is appliances collected at the EnviroDepots and recycled. 2012, 100 tonnes of appliances were collected and recycled.

The third component was the amount of appliances taken to local scrap metal dealers because they are no longer collected at the curb. It was estimated there were an additional 640 tonnes of material diverted because of the ban on appliances.

## Tire Recycling - 2,300 tonnes

The annual Municipal Datacall administered by Waste Diversion Ontario (WDO) compiles information on materials diverted and disposed by Ontario municipalities. Most of the information used by the WDO is provided by the local municipality but some of information comes from programs administered by provincial organizations. In the case of tires, information on the quantity of tires recycled in a community is provided by the Ontario Tire Stewardship. This organization looks after the Used Tires Program in Ontario and ensures tires are reused or recycled.

The 2012 WDO Datacall shows 2,300 tonnes of tires being recycled/reused in the City of London. Included in this total is called 120 tonnes of tires collected at the three City EnviroDepots as part of the Used Tire Program.

## Wood, Renovation Material \& Construction/Demolition Material Recycling - 4,540 tonnes

The City banned the collection of wood waste, renovation materials and construction/demolition waste in the 1980's. At the time the average household produced about 15 kilograms of wood waste and renovation material waste each year. At the time of the ban it was assumed about half of this material would be recycled and about half would likely continue to be landfilled as residents would hide small amounts wood waste and renovation materials in their garbage bags for collection.

Beginning in 2004, the City's EnviroDepots began to accept wood waste and renovation materials (including shingles) for recycling. The material is taken to TRY Recycling for processing were approximately $80 \%$ is made into useable products and $20 \%$ becomes residual and is landfilled.

In 2012, the EnviroDepots received 4,240 tonnes of wood waste and renovation materials. Approximately 3,390 tonnes of this material was recycled and 850 tonnes became residual waste and was landfilled.

It was assumed that approximately $1 / 2$ the residential renovation materials not taken to an EnviroDepots (1,150 tonnes) was taken to a private construction and demolition waste recycling companies (TRY Recycling and Green Valley Recycling) and recycled while other $50 \%$ ( 1,150 tonnes) was placed in the garbage or disposed of privately.

## Scrap Metal Recycling - 720 tonnes

The City stopped the collection of scrap metal (e.g., barbeques, bicycles, etc.) and appliances in the 1990's. At the time the average person produced about 2.5 kilograms of scrap metal each year. At the time of the ban it was assumed about half of this material would be recycled and about half would likely continue to be landfilled as residents would hide small amounts of metal in their garbage bags for collection.

Beginning in 2004, the City's EnviroDepots began to accept scrap metal for recycling. The material is taken to Zubick's for processing. It is assumed 100 percent of the metal is recycled. In 2012, the EnviroDepots received 500 tonnes of scrap metal.

It was assumed that approximately half the residential renovation materials not taken to an EnviroDepots (220 tonnes) was taken to other scrap metal dealers and recycled while other 50\% (220 tonnes) was placed in the garbage.

## Textile/Small Household Item Reuse/Recycling-400 tonnes

In 2012, residents could take textiles, books and small household items to a Goodwill drop off located at the Oxford Street and Clarke Road EnviroDepots. Goodwill has estimated that they received 400 tonnes of material at these locations.

## MHSW Recycling- 410 tonnes

The City collects all forms of Municipal Hazardous and Special Waste (MHSW) at the HSW depot at the W12A landfill including paints, solvents, pesticides, oil filters, used oil, antifreeze, batteries, florescent bulbs, compressed cylinders and oil \& antifreeze containers. Some of these materials (batteries, florescent bulbs, compressed cylinders and oil \& antifreeze container) are also collected at the Oxford Street and Clarke Road EnviroDepots.

The materials are shipped to various processing facilities across Ontario licensed to accept this material. The majority of the material is recycled including paint, antifreeze and oil.

The estimate of the weight of material diverted is based on a combination of actual weights for some materials and estimated weights based on the volume shipped for other materials.

## Brewer's Retail /LCBO Bottle Recycling/Reuse- 1,710 tonnes

The 2012 WDO Datacall shows 1,710 tonnes of Brewer's Retail and Liquor Control Board of Ontario (LCBO) containers being recycled/reused in the City of London. This information is provided to the WDO from Brewer's Retail.

## APPENDIX F Potential Materials to be Added to the Blue Box Program

## Introduction

The City of London accepts 14 categories of recyclable materials in its Blue Box program: newsprint \& flyers; household paper; magazines, catalogues \& books; paper egg cartons \& boxes; cardboard boxes; glass bottles \& jars; aluminum food \& beverage cans; steel food \& beverage cans; foil containers \& foil; empty metal paint cans; empty aerosol cans; plastic bottles, jugs, tubs \& trays; milk \& juice cartons; drink boxes and cardboard cans.

The existing Blue Box program includes all "low hanging fruit", materials that can be managed at a reasonable cost or constitute a large portion of the waste stream. A review of other municipalities in Ontario found six "more difficult" to recycle materials that are being recycled by at least one municipality. These materials are:

1. Mixed Polycoat (e.g., coffee cups, cold beverage cups, ice cream containers)
2. Batteries (limited to single use batteries)
3. Metal Cookware (e.g., pots, pans)
4. Blister Packaging (e.g., rigid plastic around toys, hardware)
5. Film plastic (e.g., plastic bags)
6. Expanded Polystyrene (e.g., meat trays, foam cups, packaging materials)

The financial, environmental and social considerations as well as technical issues of adding these materials to the City's Blue Box recycling program are presented in Tables F-1 and F2.

In summary, the following materials require further investigation before a final recommendation can be made with respect to adding them to the Blue Box Program: mixed polycoat (e.g., coffee cups, cold beverage cups, ice cream containers); batteries (limited to single use batteries); metal cookware (e.g., pots, pans); and blister packaging (e.g., rigid plastic around toys, hardware).

The following materials are not recommended to be added to the Blue Box Program: film plastic (e.g., plastic bags) and expanded polystyrene (e.g., meat trays, foam cups, packaging materials).

Table F-1: Overview of Key Environmental, Social \& Financial Considerations and Technical Issues of Materials that Need Further Investigation

| Consideration |  | Material Recommended for Further Investigation |  |
| :---: | :---: | :---: | :---: |
|  |  | Mixed Polycoat (e.g., coffee cups, ice cream containers) | Blister Packaging (e.g., rigid packaging around toys) |
|  | Estimated Annual Tonnes Diverted | 190 | 40 |
|  | Estimated Annual Units Diverted (a) | 15,000,000 | 1,000,000 |
|  | Annual GHG Savings Equivalent to (b) | 400 tonnes <br> 100 cars removed from the road | 80 tonnes <br> 24 cars removed from the road |
|  | Annual Energy Savings Equivalent to (c) | $3,300 \mathrm{GJ}$ <br> 100 homes supplied with electricity | 2,400 GJ <br> 70 homes supplied with electricity |
|  | Public Support | - Strong <br> - $10 \%$ to $20 \%$ of material already being placed in Blue Box | - Average <br> - $5 \%$ of material already being placed in Blue Box |
|  | Resident Issues | - May be confusion where to place (paper products or containers) <br> - Light weight materials may increase street litter on windy days | - Removes some confusion of which plastics are recyclable <br> - Light weight materials may increase street litter on windy days |
|  | Additional Col-lection Cost (d) | \$0 | \$5,000 |
|  | Estimated Processing Cost (d) | \$30,000 to \$40,000 | \$3,000 |
|  | Market/Revenue | - Limited markets but growing <br> - $\$ 60$ to $\$ 120 /$ tonne ( $\$ 7,000$ to \$15,000/yr) | - Limited markets but growing <br> - $\$ 30$ to $\$ 50$ /tonne ( $\$ 1,000$ to $\$ 2,000 / y r$ ) <br> - Some municipalities staring to collect |
| İU©© | Collection Issues | - None | - None |
|  | Processing Issues | - Regional MRF capable of processing <br> - Possible contamination issues from lids being left on or food placed inside container | - Regional MRF capable of processing <br> - Possible contamination issues if resident does not remove paper inside plastic packaging |

## Notes

(a) Based on average size of units.
(b) Estimated Greenhouse Gas (GHG) savings are the emissions avoided equivalent to the specified number of cars being removed from the road per year (i.e., the recycling of these materials has avoided the GHG emissions equivalent to the identified number of vehicles per year). GHG savings were estimated using the EPA Warm Model.
(c) Estimated energy savings equivalent to the amount of electricity not being used by the specified number of homes per year (i.e., the recycling of these materials has avoided the equivalent electricity consumption requirements of the identified number of homes per year). Energy savings were estimated using the EPA Warm Model.
(d) Estimates provided by current contractor (Miller Waste Systems).

## Table F-1: Overview of Key Environmental, Social \& Financial Considerations and Technical Issues of Materials that Need Further Investigation

| Consideration |  | Material Recommended for Further Investigation |  |
| :---: | :--- | :---: | :---: | :---: |

## Notes

(a) Based on average size of units.
(b) Estimated Greenhouse Gas (GHG) savings are the emissions avoided equivalent to the specified number of cars being removed from the road per year (i.e., the recycling of these materials has avoided the GHG emissions equivalent to the identified number of vehicles per year). GHG savings were estimated using the EPA Warm Model.
(c) Estimated energy savings equivalent to the amount of electricity not being used by the specified number of homes per year (i.e., the recycling of these materials has avoided the equivalent electricity consumption requirements of the identified number of homes per year). Energy savings were estimated using the EPA Warm Model.
(d) Estimates provided by current contractor (Miller Waste Systems).

Table F-2: Overview of Key Environmental, Social, Financial Considerations \&Technical Issues of Materials not Recommended to be Added to the Blue Box Recycling Program

| Consideration |  | Material not Recommended to be Added |  |
| :---: | :---: | :---: | :---: |
|  |  | Film Plastic (e.g., grocery bags) | Expanded Foam Polystyrene (e.g., meat trays) |
|  | Estimated Annual Tonnes Diverted | 400 | 60 |
|  | Estimated Annual Units Diverted (a) | 50,000,000 | 7,500,000 |
|  | Annual GHG Savings Equivalent to (b) | 400 tonnes <br> 100 cars removed from the road | 60 tonnes 15 cars removed from the road |
|  | Annual Energy <br> Savings Equivalent to <br> (c) | $18,000 \text { GJ }$ <br> 500 homes supplied with electricity | 2,600 GJ <br> 80 homes supplied with electricity |
|  | Public Support | - Strong | - Strong |
|  | Resident Issues | - Light weight materials may increase street litter on windy days <br> - Residents can already recycle plastic bags at many retail outlets | - Light weight materials may increase street litter on windy days <br> - Some packaging is too large to collect |
|  | Additional Col-lection Cost (d) | \$200,000 to \$225,000 | \$125,000 to \$150,000 |
|  | Estimated Processing Cost (d) | \$400,000 to \$450,000 | \$150,000 to \$200,000 |
|  | Market/Revenue | - North American <br> - Stable <br> - Revenue significantly less than processing cost <br> - 0 to $\$ 30 /$ tonne ( $\$ 0-\$ 15,000 / \mathrm{yr}$ ) | - Limited Markets <br> - Unstable <br> - Revenue significantly less than processing cost <br> - \$300 to \$700/tonne (\$10,000-\$25,000/yr) |
| $\begin{aligned} & \overline{\widetilde{J}} \\ & \stackrel{U}{E} \\ & \bar{U} \\ & \text { © } \end{aligned}$ | Collection Issues | - None | - None |
|  | Processing Issues | - Regional MRF capable of processing <br> - May cause cross-contamination <br> - May increase equipment maintenance requirements | - Regional MRF capable of processing <br> - May cause cross-contamination and increase equipment maintenance <br> - Low capture (majority breaks up goes to residue); only 180 tonnes recycled from 3.0 million homes with program in 2012 |
