APPENDICES

Appendix A. Waste Audit Data

1.0 INTRODUCTION

The Continuous Improvement Fund (CIF) contracted AET Group Inc. (AET) to analyze two-stream recycling data single-family (SF) residential and multi-family (MF) waste composition studies completed between 2016 and 2020. The analysis included municipal groups classified as Medium Urban and Rural Regional. A total of four Medium Urban municipalities and five Rural Regional municipalities were analyzed.

1.1 Objectives

Calculate and summarize:

- Overall contamination rates (i.e. proportion of each stream and combined that is non-accepted materials);
- Cross-contamination rates (i.e. proportion of containers and fibres recycling streams that is materials that should have been in the opposite stream); and
- Ratio of containers stream vs. fibres stream as set out by residents (by weight).

2.0 METHODOLOGY

2.1 Data Source

Data was analyzed from CIF/Stewardship Ontario's Waste Composition Audits Terms of Reference Years 1-4 results (2016/2017, 2017/2018, 2018/2019 and 2019/2020)¹. Although material categories were the same for all audits, a particular material's classification as recyclable or contamination was dependant on each individual municipality's acceptance criteria. It must be noted that the final spring season of the 2019/2020 audits has not been completed at the time of this report, therefore the data analyzed for 2019/2020 Rural Regional is a 3-season average.

2.2 Calculations

The calculations used to analyze the waste audit results are as follows:

Kg/hh/wk = kilograms/household/week

4-Season Average (kg/hh/wk):

$$\left(\frac{\text{Spring (kg/hh/wk)} + \text{Summer (kg/hh/wk)} + \text{Fall (kg/hh/wk)} + \text{Winter (kg/hh/wk)}}{4} \right)$$

¹ <https://thecif.ca/waste-composition-studies/>

Contamination Rate:

$$\left(\frac{\text{Total amount of non-recyclable material in stream}}{\text{Total amount of material set-out in stream}} \right) \times 100\%$$

Note: “non-recyclable” material as defined by each respective municipal program

Cross Contamination Rate:

$$\left(\frac{\text{Total amount of fibres placed in the containers stream}}{\text{Total amount of material set-out in the containers stream}} \right) \times 100\%$$

OR

$$\left(\frac{\text{Total amount of containers placed in the fibres stream}}{\text{Total amount of material set-out in the fibres stream}} \right) \times 100\%$$

3.0 RESULTS AND DISCUSSION

3.1 Proportion of Recycling Set Out by Stream

Figure 3.1 illustrates the proportion of recycling set-out by Medium Urban municipal groups. On average, 66.57% (1.92 kg/hh/wk) of recycling is placed in the fibres stream and the remaining 33.43% (0.96 kg/hh/wk) is placed in the containers stream.

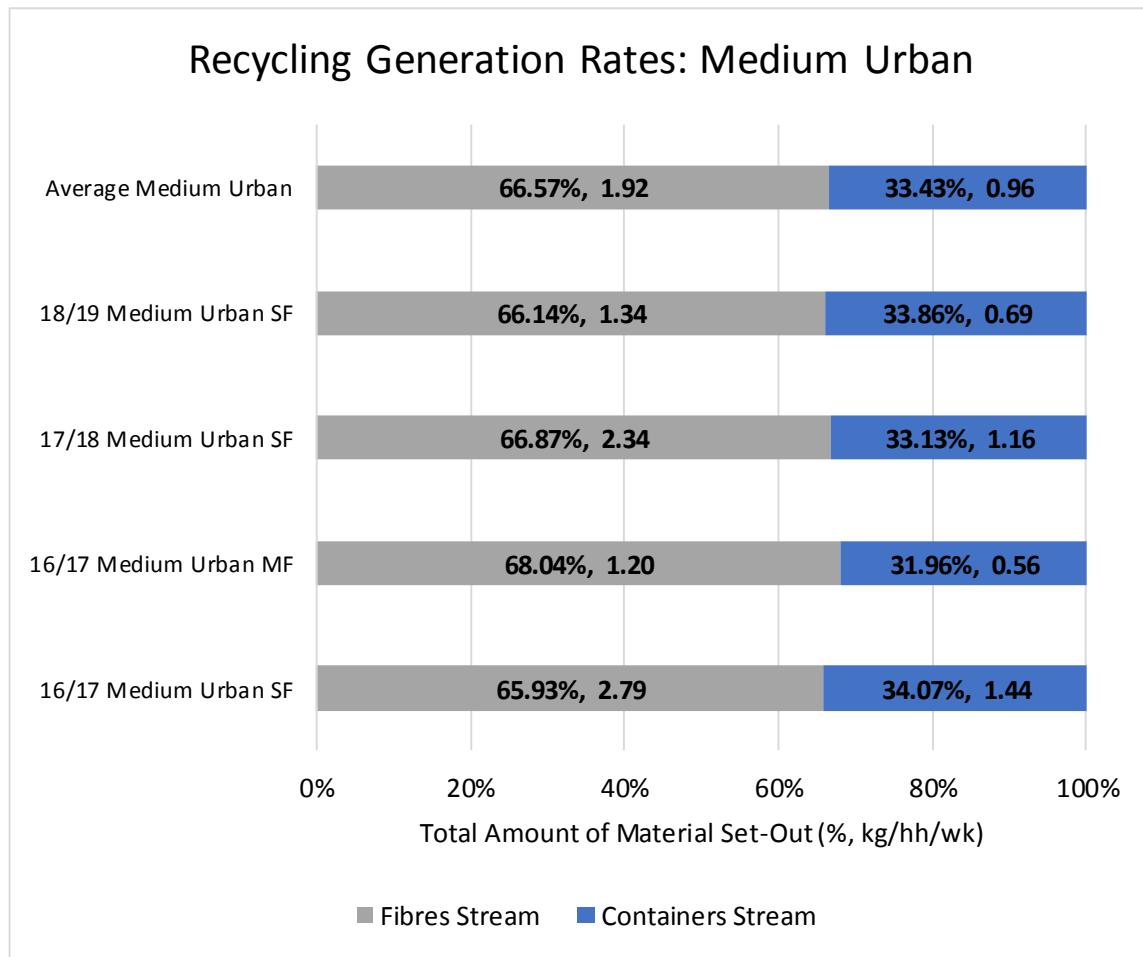

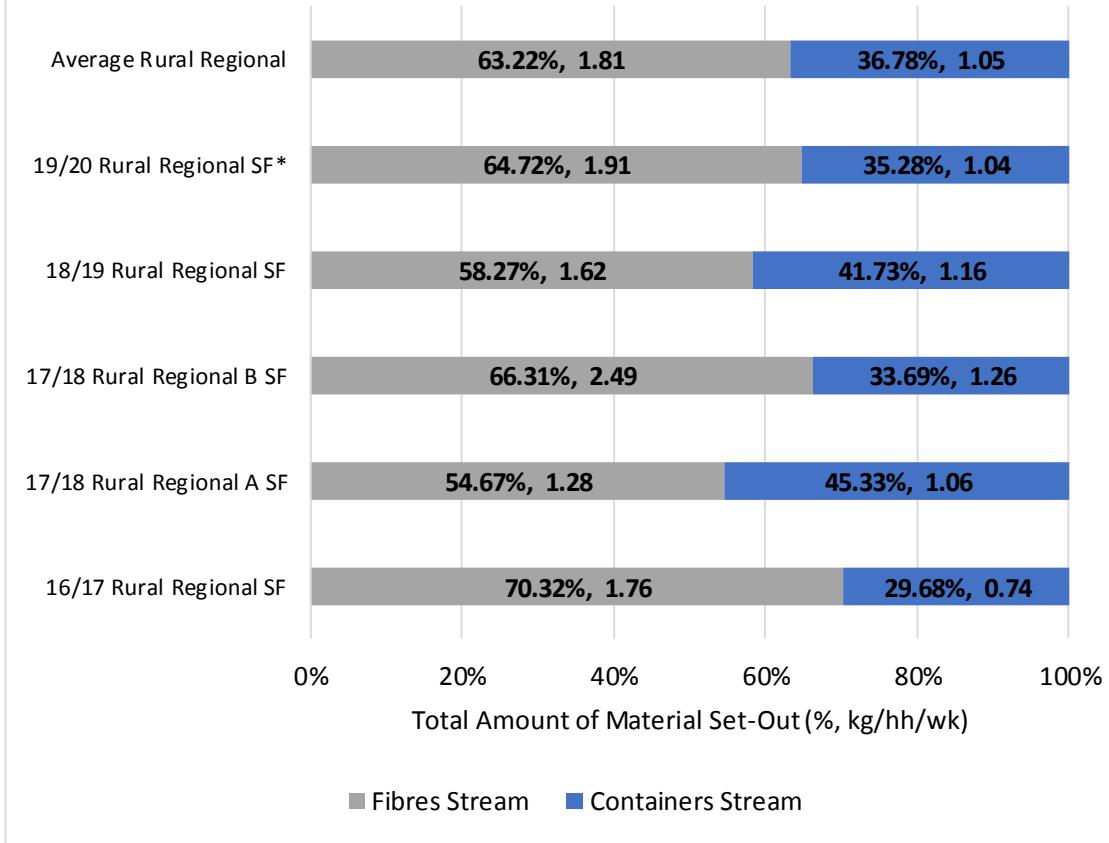

Figure 3.1 Proportion of Recycling Set-Out (by stream) – Medium Urban

Figure 3.2 illustrates the proportion of recycling set-out by Rural Regional municipal groups. On average, 63.22% (1.81 kg/hh/wk) of recycling is placed in the fibres stream and the remaining 36.78% (1.05 kg/hh/wk) is placed in the containers stream.

Recycling Generation Rates: Rural Regional

* 19/20 Rural Regional SF represents a 3-season average, as the last seasonal audit (Spring 2020) had not been completed at time of this report

Figure 3.2 Proportion of Recycling Set-Out (by stream) – Rural Regional

3.2 Contamination in the Recycling Stream

The following section summarizes the overall contamination and cross-contamination rates in the recycling streams. Figure 3.3 illustrates the breakdown of the fibres recycling stream from Medium Urban municipal groups. On average, 94.31% of the fibres stream consisted of accepted fibres, 3.11% consisted of cross-contaminating containers and 2.58% consisted of contamination (non-accepted materials).

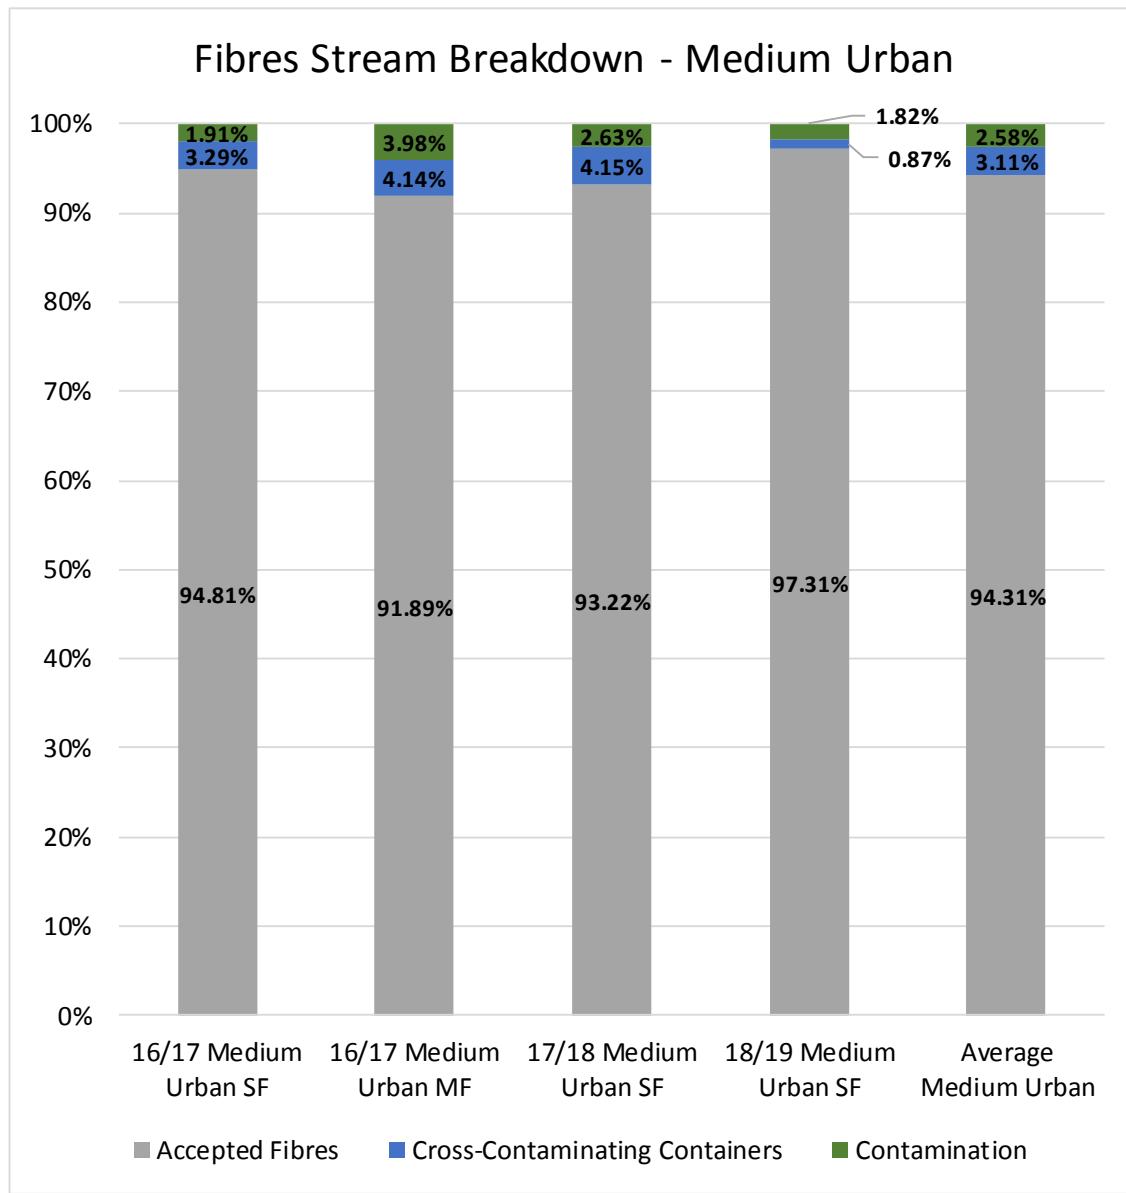

Figure 3.3 Fibres Stream Breakdown – Medium Urban

Figure 3.4 illustrates the breakdown of the fibres recycling stream from Rural Regional municipal groups. On average, 95.87% of the fibres stream consisted of accepted fibres, 1.60% consisted of cross-contaminating containers and 2.53% consisted of contamination (non-accepted materials).

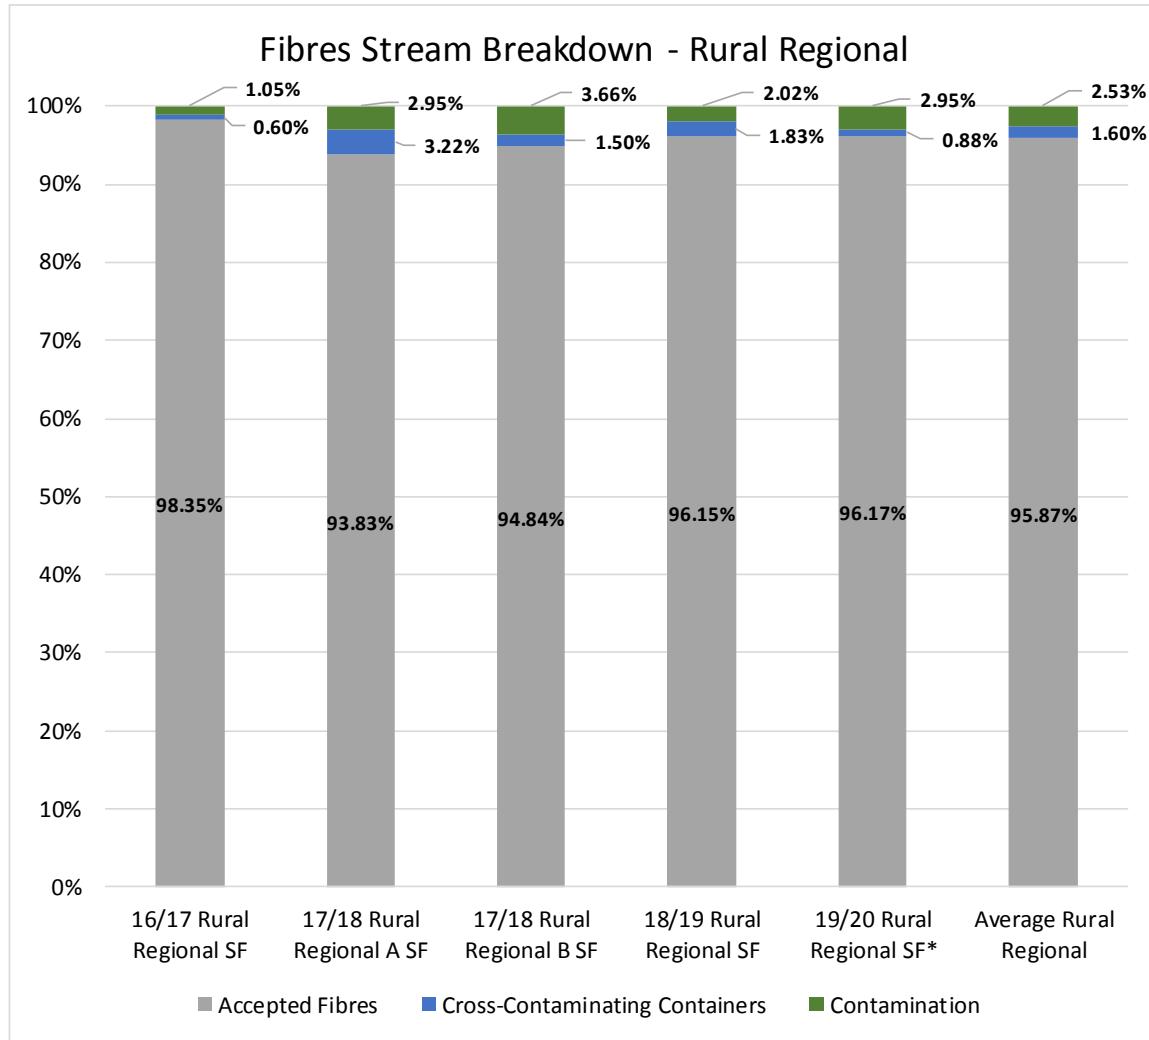

Figure 3.4 Fibres Stream Breakdown – Rural Regional

Figure 3.5 illustrates the breakdown of the containers recycling stream from Medium Urban municipal groups. On average, 79.27% of the containers stream consisted of accepted containers, 5.96% consisted of cross-contaminating fibres and 14.77% consisted of contamination (non-accepted materials).

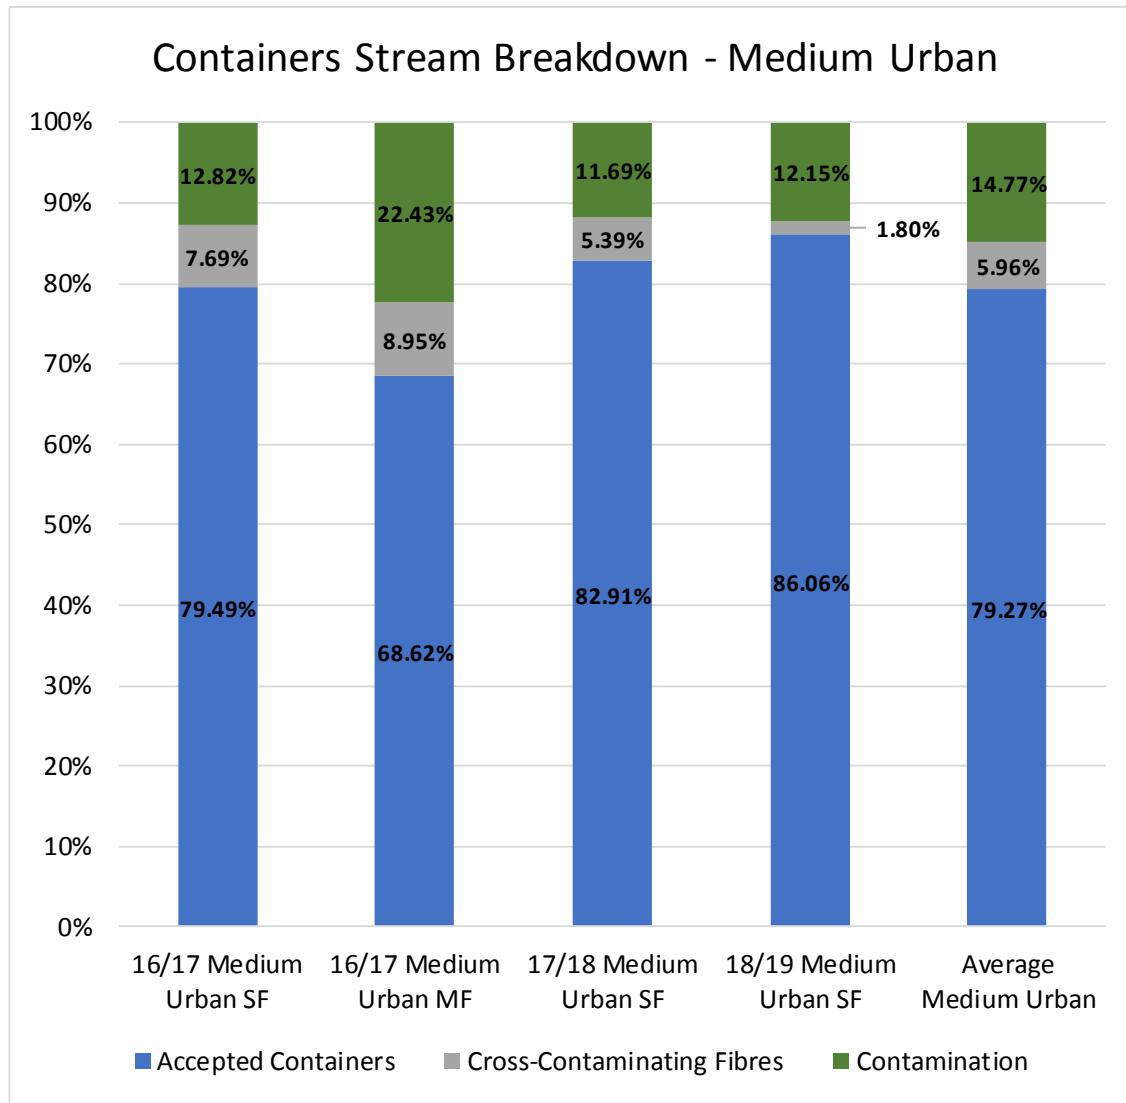

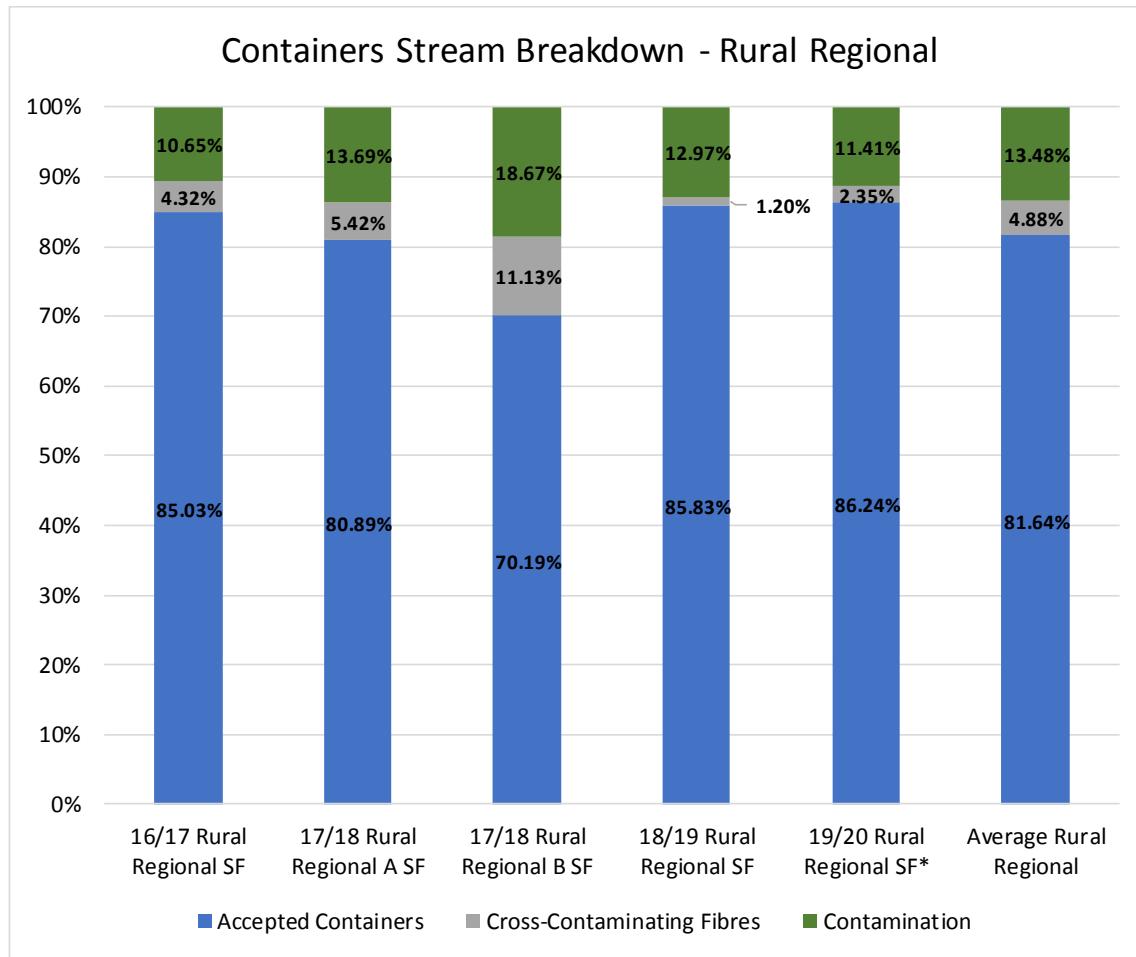

Figure 3.5 Containers Stream Breakdown – Medium Urban

Figure 3.6 illustrates the breakdown of the containers recycling stream from Rural Regional municipal groups. On average, 81.64% of the containers stream consisted of accepted containers, 4.88% consisted of cross-contaminating fibres and 13.48% consisted of contamination (non-accepted materials).

* 19/20 Rural Regional SF represents a 3-season average, as the last seasonal audit (Spring 2020) had not been completed at time of this report

Figure 3.6 Containers Stream Breakdown – Rural Regional

Figure 3.7 illustrates the breakdown of the recycling stream (fibres and containers combined) from Medium Urban municipal groups. It must be noted that this figure illustrates the combined composition but does not show cross-contamination. On average, 64.90% of the recycling stream consisted of accepted fibres, 28.49% consisted of accepted containers and 6.61% consisted of contamination (non-accepted materials).

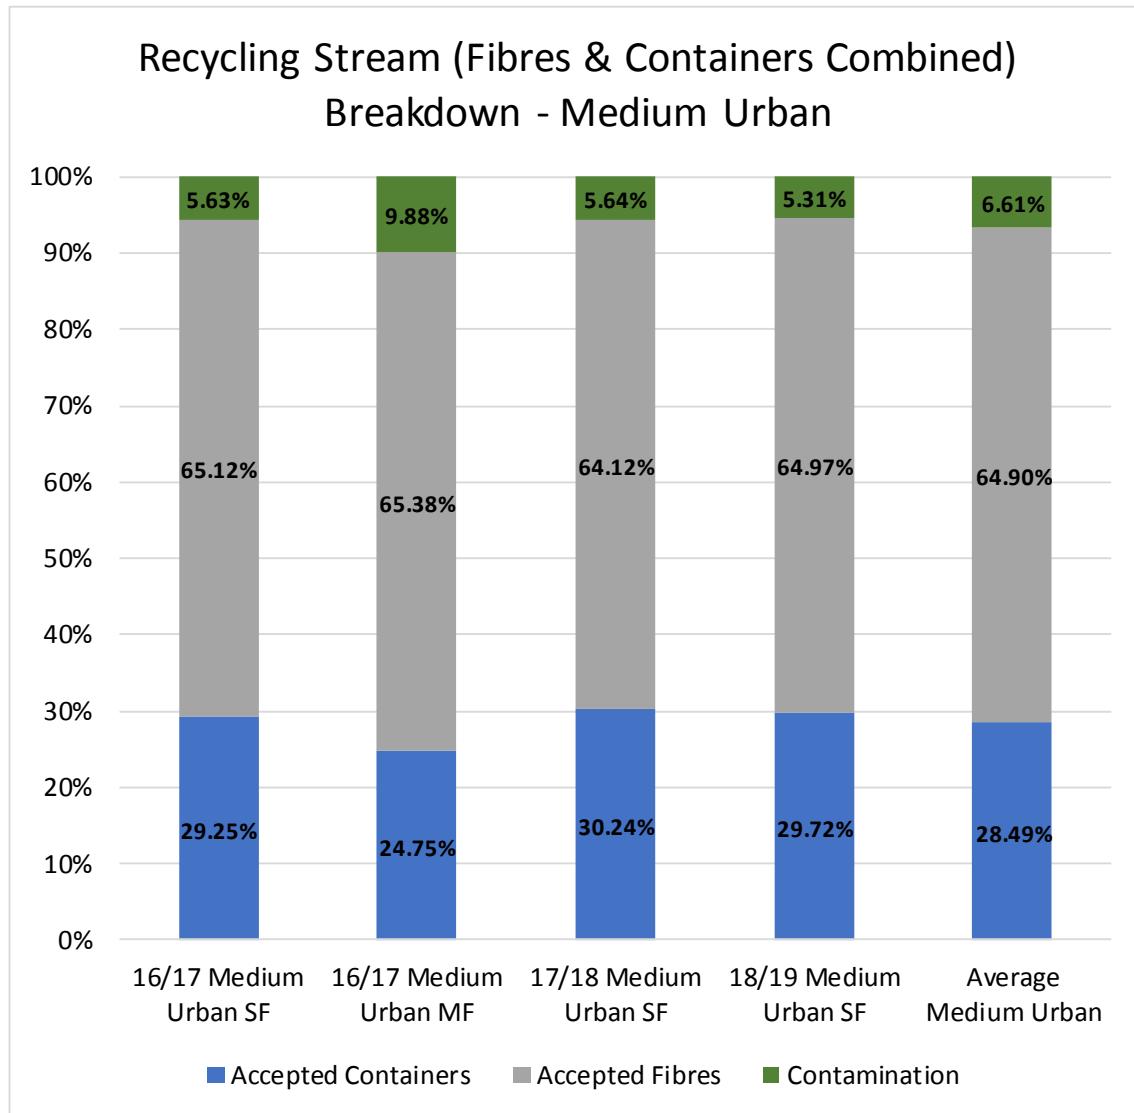

Figure 3.7 Recycling Stream Breakdown (fibres & containers combined) – Medium Urban

Figure 3.8 illustrates the breakdown of the recycling stream (fibres and containers combined) from Rural Regional municipal groups. It must be noted that this figure illustrates the combined composition but does not show cross-contamination. On average, 62.09% of the recycling stream consisted of accepted fibres, 31.32% consisted of accepted containers and 6.59% consisted of contamination (non-accepted materials).
